

Chapter 2

Console Input and Output

Slides prepared by Rose Williams, Binghamton University

Kenrick Mock, *University of Alaska Anchorage*

PEARSON

ALWAYS LEARNING

2-3

System.out.println for console output

- **System.out** is an object that is part of the Java language
- println is a method invoked by the System.out object that can be used for console output
 - The data to be output is given as an argument in parentheses
 - A plus sign is used to connect more than one item
 - Every invocation of println ends a line of output
 System.out.println("The answer is " + 42);

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-2

println Versus print

- Another method that can be invoked by the System.out object is print
- The **print** method is like **println**, except that it does not end a line
 - With println, the next output goes on a new line
 - With print, the next output goes on the same line

Formatting Output with printf

- Starting with version 5.0, Java includes a method named printf that can be used to produce output in a specific format
- The Java method **printf** is similar to the **print** method
 - Like print, printf does not advance the output to the next line
- **System.out.printf** can have any number of arguments
 - The first argument is always a format string that contains one or more format specifiers for the remaining arguments
 - All the arguments except the first are values to be output to the screen

printf Format Specifier

The code

```
double price = 19.8;
   System.out.print("$");
   System.out.printf("%6.2f", price);
   System.out.println(" each");
will output the line
   $ 19.80 each
```

- The format string "%6.2f" indicates the following:
 - End any text to be output and start the format specifier (%)
 - Display up to 6 right-justified characters, pad fewer than six characters on the left with blank spaces (i.e., field width is 6)
 - Display exactly 2 digits after the decimal point (.2)
 - Display a floating point number, and end the format specifier (i.e., the conversion character is £)

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-5

2-7

Right and Left Justification in printf

The code

```
double value = 12.123;
    System.out.printf("Start%8.2fEnd", value);
    System.out.println();
    System.out.printf("Start%-8.2fEnd", value);
    System.out.println();
will output the following
    Start 12.12End
    Start12.12    End
```

- The format string "Start%8.2fEnd" produces output that is right
 justified with three blank spaces before the 12.12
- The format string "Start%-8.2fEnd" produces output that is left justified with three blank spaces after the 12.12

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-6

Multiple arguments with printf

- The following code contains a **printf** statement having three arguments
 - The code

- Note that the first argument is a format string containing two format specifiers (%6.2f and %s)
- These format specifiers match up with the two arguments that follow (price and name)

Line Breaks with printf

- Line breaks can be included in a format string using
 %n
- The code

```
double price = 19.8;
   String name = "magic apple";
   System.outprintf("$%6.2f for each %s.%n",
        price, name);
   System.out.println("Wow");

will output
   $ 19.80 for each magic apple.
   Wow
```

Format Specifiers for System.out.printf

Display 2.1 Format Specifiers for System.out.printf

CONVERSION CHARACTER		
d	Decimal (ordinary) integer	%5d %d
f	Fixed-point (everyday notation) floating point	%6.2f %f
е	E-notation floating point	%8.3e %e
g	General floating point (Java decides whether to use E-notation or not)	%8.3g %g
S	String	%12s %s
с	Character	%2c %c

2-10

The **printf** Method (Part 2 of 3)

Display 2.2 The printf Method 12 char oneChracter = 'Z'; 13 System.out.println("Character output:"): 14 System.out.println("START1234567890"); 15 System.out.printf("START%cEND %n", oneCharacter); 16 System.out.printf("START%4cEND %n", oneCharacter); 17 System.out.println(): 18 double d = 12345.123456789; 19 System.out.println("Floating-point output:"); 20 System.out.println("START1234567890"); 21 System.out.printf("START%fEND %n", d); 22 System.out.printf("START%.4fEND %n", d); 23 System.out.printf("START%.2fEND %n", d); 24 System.out.printf("START%12.4fEND %n", d); 25 System.out.printf("START%eEND %n", d); 26 System.out.printf("START%12.5eEND %n", d); 27 28 }

The **printf** Method (Part 3 of 3)

Display 2.2 The printf Method

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-12

Formatting Money Amounts with printf

- A good format specifier for outputting an amount of money stored as a double type is %.2f
- It says to include exactly two digits after the decimal point and to use the smallest field width that the value will fit into:

```
double price = 19.99;
System.out.printf("The price is $%.2f each.")
produces the output:
   The price is $19.99 each.
```

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-13

Legacy Code

- Code that is "old fashioned" but too expensive to replace is called *legacy code*
- Sometimes legacy code is translated into a more modern language
- The Java method printf is just like a C language function of the same name
- This was done intentionally to make it easier to translate C code into Java

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-14

Money Formats

- Using the NumberFormat class enables a program to output amounts of money using the appropriate format
 - The NumberFormat class must first be imported in order to use it import java.text.NumberFormat
 - An object of NumberFormat must then be created using the getCurrencyInstance() method
 - The format method takes a floating-point number as an argument and returns a String value representation of the number in the local currency

Money Formats

Money Formats

Output of the previous program

```
Default location:

$19.80

$19.81

$19.90

$19.00
```

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-17

2-19

Specifying Locale

- Invoking the getCurrencyInstance() method without any arguments produces an object that will format numbers according to the default location
- In contrast, the location can be explicitly specified by providing a location from the Locale class as an argument to the getCurrencyInstance() method
 - When doing so, the Locale class must first be imported import java.util.Locale;

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-18

Specifiying Locale

Specifying Locale

Output of the previous program

```
US as location:

$19.80

$19.81

$19.90

$19.00
```

Locale Constants for Currencies of Different Countries

Display 2.4 Loca	le Constants for Currencies of Different Countries
Locale.CANADA	Canada (for currency, the format is the same as US)
Locale.CHINA	China
Locale.FRANCE	France
Locale.GERMANY	Germany
Locale.ITALY	Italy
Locale.JAPAN	Japan
Locale.KOREA	Korea
Locale.TAIWAN	Taiwan
Locale.UK	United Kingdom (English pound)
Locale.US	United States

2-21

Importing Packages and Classes

- Libraries in Java are called packages
 - A package is a collection of classes that is stored in a manner that makes it easily accessible to any program
 - In order to use a class that belongs to a package, the class must be brought into a program using an *import* statement
 - Classes found in the package java.lang are imported automatically into every Java program

```
import java.text.NumberFormat;
// import theNumberFormat class only
import java.text.*;
//import all the classes in package java.text
```

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-22

The **DecimalFormat** Class

- Using the <u>DecimalFormat</u> class enables a program to format numbers in a variety of ways
 - The **DecimalFormat** class must first be *imported*
 - A DecimalFormat object is associated with a pattern when it is created using the new command
 - The object can then be used with the method format to create strings that satisfy the format
 - An object of the class DecimalFormat has a number of different methods that can be used to produce numeral strings in various formats

The **DecimalFormat** Class (Part 1 of 3)

```
Display 2.5 The DecimalFormat Class
 1 import java.text.DecimalFormat;
    public class DecimalFormatDemo
        public static void main(String[] args)
            DecimalFormat pattern00dot000 = new DecimalFormat("00.000");
            DecimalFormat pattern0dot00 = new DecimalFormat("0.00");
            double d = 12.3456789;
            System.out.println("Pattern 00.000");
            System.out.println(pattern00dot000.format(d));
            System.out.println("Pattern 0.00");
            System.out.println(pattern0dot00.format(d));
13
            double money = 19.8:
            System.out.println("Pattern 0.00");
            System.out.println("$" + pattern0dot00.format(money));
15
16
            DecimalFormat percent = new DecimalFormat("0.00%");
                                                                          (continued)
```

2-23

The **DecimalFormat** Class (Part 2 of 3)

2-26

Console Input Using the Scanner Class

- Starting with version 5.0, Java includes a class for doing simple keyboard input named the **Scanner** class
- In order to use the **Scanner** class, a program must include the following line near the start of the file:

```
import java.util.Scanner
```

- This statement tells Java to
 - Make the **Scanner** class available to the program
 - Find the Scanner class in a library of classes (i.e., Java package) named java.util

Console Input Using the Scanner Class

The following line creates an object of the class
 Scanner and names the object keyboard:

```
Scanner keyboard = new Scanner(System.in);
```

- Although a name like keyboard is often used, a Scanner object can be given any name
 - For example, in the following code the Scanner object is named scannerObject

```
Scanner scannerObject = new
Scanner(System.in);
```

 Once a Scanner object has been created, a program can then use that object to perform keyboard input using methods of the Scanner class

Console Input Using the Scanner Class

• The method **nextInt** reads one **int** value typed in at the keyboard and assigns it to a variable:

```
int numberOfPods = keyboard.nextInt();
```

 The method nextDouble reads one double value typed in at the keyboard and assigns it to a variable:

```
double d1 = keyboard.nextDouble();
```

- Multiple inputs must be separated by whitespace and read by multiple invocations of the appropriate method
 - Whitespace is any string of characters, such as blank spaces, tabs, and line breaks that print out as white space

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-29

Console Input Using the Scanner Class

- The method next reads one string of non-whitespace characters delimited by whitespace characters such as blanks or the beginning or end of a line
- Given the code

```
String word1 = keyboard.next();
String word2 = keyboard.next();
and the input line
jelly beans
```

The value of word1 would be jelly, and the value of word2 would be beans

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-30

Console Input Using the Scanner Class

- The method nextLine reads an entire line of keyboard input
- The code,

```
String line = keyboard.nextLine(); reads in an entire line and places the string that is read into the variable line
```

- The end of an input line is indicated by the escape sequence '\n'
 - This is the character input when the **Enter** key is pressed
 - On the screen it is indicated by the ending of one line and the beginning of the next line
- When nextLine reads a line of text, it reads the '\n' character, so
 the next reading of input begins on the next line
 - However, the '\n' does not become part of the string value returned (e.g., the string named by the variable line above does not end with the '\n' character)

Keyboard Input Demonstration (Part 1 of 2)

```
Display 2.6 Keyboard Input Demonstration
 1 import java.util.Scanner;
                                                 Makes the Scanner class available to
     public class ScannerDemo
                                                         Creates an object of the class
       public static void main(String[] args)
                                                         Scanner and names the
                                                         object keyboard.
          Scanner keyboard = new Scanner(System.in);
          System.out.println("Enter the number of pods followed by");
          System.out.println("the number of peas in a pod:");
          int numberOfPods = keyboard.nextInt();
          int peasPerPod = keyboard.nextInt();
          int totalNumberOfPeas = numberOfPods*peasPerPod;
          System.out.print(numberOfPods + " pods and ");
13
          System.out.println(peasPerPod + " peas per pod.");
          System.out.println("The total number of peas = "
15
                                              + totalNumberOfPeas):

Reads one double from
15
            double d1, d2;
                                                             the keyboard.
             d1 = scannerObject.nextDouble();
16
17
             d2 = scannerObject.nextDouble();
18
             System.out.println("You entered " + d1 + " and " + d2);
19
             System.out.println("Next enter two words:"):
                                                                 Reads one word from
                                                                 the keyboard.
            String word1 = scannerObject.next();
21
             String word2 = scannerObject.next();
22
             System.out.println("You entered \"" +
23
                                    word1 + "\" and \"" + word2 + "\"");
            String junk = scannerObject.nextLine(); //To get rid of '\n'
24
             System.out.println("Next enter a line of text:");
25
26
             String line = scannerObject.nextLine();
                                                                    explained in the
27
             System.out.println("You entered: \"" + line + "\"");
28
                                                                    "Dealing with the
                                 Reads an entire line.
                                                                   Line Terminator
```

(continued)

2-35

Another Keyboard Input Demonstration (Part 3 of 3)

Display 2.7 Another Keyboard Input Demonstration

```
Enter two whole numbers
separated by one or more spaces:
42   43
You entered 42 and 43
Next enter two numbers.
A decimal point is OK.
9.99   57
You entered 9.99 and 57.0
Next enter two words:
jelly beans
You entered "jelly" and "beans"
Next enter a line of text:
Java flavored jelly beans are my favorite.
You entered "Java flavored jelly beans are my favorite."
```

Pitfall: Dealing with the Line Terminator, '\n'

- The method nextLine of the class scanner reads the remainder of a line of text starting wherever the last keyboard reading left off
- This can cause problems when combining it with different methods for reading from the keyboard such as nextInt
- Given the code,

```
Scanner keyboard = new Scanner(System.in);
int n = keyboard.nextInt();
String s1 = keyboard.nextLine();
String s2 = keyboard.nextLine();
and the input,
2
Heads are better than
1 head.
what are the values of n, s1, and s2?
```

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-37

Pitfall: Dealing with the Line Terminator, '\n'

Given the code and input on the previous slide

```
n will be equal to "2",
s1 will be equal to "", and
s2 will be equal to "heads are better than"
```

If the following results were desired instead

```
n equal to "2",
s1 equal to "heads are better than", and
s2 equal to "1 head"
```

then an extra invocation of **nextLine** would be needed to get rid of the end of line character ('\n')

Copyright © 2012 Pearson Addison-Wesley. All rights reserved.

2-38

Methods in the Class **Scanner** (Part 1 of 3)

Display 2.8 Methods of the Scanner Class

The Scanner class can be used to obtain input from files as well as from the keyboard. However, here we are assuming it is being used only for input from the keyboard.

To set things up for keyboard input, you need the following at the beginning of the file with the keyboard input code:

import java.util.Scanner;

You also need the following before the first keyboard input statement:

Scanner Scannner_Object_Name = new Scanner(System.in);

The Scannner_Object_Name can then be used with the following methods to read and return various types of data typed on the keyboard.

Values to be read should be separated by whitespace characters, such as blanks and/or new lines. When reading values, these whitespace characters are skipped. (It is possible to change the separators from whitespace to something else, but whitespace is the default and is what we will use.)

Scannner_Object_Name.nextInt()

Returns the next value of type int that is typed on the keyboard.

(continued)

2-39

Methods in the Class **Scanner** (Part 2 of 3)

Display 2.8 Methods of the Scanner Class

Returns the next value of type long that is typed on the keyboard.

Scannner_Object_Name.nextByte()

Scannner_Object_Name.nextLong()

Returns the next value of type byte that is typed on the keyboard.

Scannner_Object_Name.nextShort()

Returns the next value of type short that is typed on the keyboard.

Scannner_Object_Name.nextDouble()

Returns the next value of type double that is typed on the keyboard.

Scannner_Object_Name.nextFloat()

Returns the next value of type float that is typed on the keyboard.

continued)

Methods in the Class Scanner (Part 3 of 3)

Display 2.8 Methods of the Scanner Class

Scannner_Object_Name.next() Returns the String value consisting of the next keyboard characters up to, but not including, the first delimiter character. The default delimiters are whitespace characters. Scannner_Object_Name.nextBoolean() Returns the next value of type boolean that is typed on the keyboard. The values of true and false are entered as the strings "true" and "false". Any combination of upper- and/or lowercase letters is allowed in spelling "true" and "false" Scanner_Object_Name.nextLine() Reads the rest of the current keyboard input line and returns the characters read as a value of type String. Note that the line terminator '\n' is read and discarded; it is not included in the string returned. Scanner_Object_Name.useDelimiter(New_Delimiter); Changes the delimiter for keyboard input with Scanner_Object_Name. The New_Delimiter is a value of type String. After this statement is executed, New_Delimiter is the only delimiter that separates words or numbers. See the subsection "Other Input Delimiters" for details.

2-41

Programming Tip: Prompt for Input

• A program should always prompt the user when he or she needs to input some data:

```
System.out.println(
  "Enter the number of pods followed by");
System.out.println(
  "the number of peas in a pod:");
```

2-42

Programming Tip: Echo Input

- Always echo all input that a program receives from the keyboard
- In this way a user can check that he or she has entered the input correctly
 - Even though the input is automatically displayed as the user enters it, echoing the input may expose subtle errors (such as entering the letter "O" instead of a zero)

Self-Service Checkout Line (Part 1 of 2)

```
Display 2.9 Self-Service Check Out Line
1 import java.util.Scanner;
    public class SelfService
        public static void main(String[] args)
            Scanner keyboard = new Scanner(System.in);
            System.out.println("Enter number of items purchased");
            System.out.println("followed by the cost of one item.");
            System.out.println("Do not use a dollar sign.");
            int count = keyboard.nextInt();
            double price = keyboard.nextDouble();
            double total = count*price;
            System.out.printf("%d items at $%.2f each.%n", count, price);
            System.out.printf("Total amount due $%.2f.%n", total);
            System.out.println("Please take your merchandise.");
            System.out.printf("Place $%.2f in an envelope %n", total);
            System.out.println("and slide it under the office door.");
            System.out.println("Thank you for using the self-service line.");
19
                                                  The dot after %. 2f is a period in the
20 }
                                                  text, not part of the format specifier.
```

Self-Service Checkout Line (Part 2 of 2)

Display 2.9 Self-Service Check Out Line

```
SAMPLE DIALOGUE
 Enter number of items purchased
 followed by the cost of one item.
 Do not use a dollar sign.
  10 19.99
 10 items at $19.99 each.
 Total amount due $199.90.
 Please take your merchandise.
 Place $199.90 in an envelope
 and slide it under the office door.
 Thank you for using the self-service line.
```

2-45

The Empty String

- A string can have any number of characters, including zero characters
 - "" is the empty string
- When a program executes the **nextLine** method to read a line of text, and the user types nothing on the line but presses the Enter key, then the nextLine Method reads the empty string

2-46

Other Input Delimiters

- The delimiters that separate keyboard input can be changed when using the **Scanner** class
- For example, the following code could be used to create a **Scanner** object and change the delimiter from whitespace to "##"

```
Scanner keyboard2 = new Scanner(System.in);
Keyboard2.useDelimiter("##");
```

• After invocation of the useDelimiter method, "##" and not whitespace will be the only input delimiter for the input object **keyboard2**

Changing the Input Delimiter (Part 1 of 3)

```
Display 2.10 Changing the Input Delimiter
1 import java.util.Scanner;
    public class DelimiterDemo
        public static void main(String[] args)
            Scanner keyboard1 = new Scanner(System.in);
            Scanner keyboard2 = new Scanner(System.in);
            keyboard2.useDelimiter("##");
            //Delimiter for keyboard1 is whitespace.
            //Delimiter for keyboard2 is ##.
                                                                         (continued)
```

Changing the Input Delimiter (Part 2 of 3)

Display 2.10 Changing the Input Delimiter 11 String word1, word2; 12 System.out.println("Enter a line of text:"); 13 word1 = keyboard1.next(): 14 word2 = keyboard1.next(); 15 System.out.println("For keyboard1 the two words read are:"); 16 System.out.println(word1); 17 System.out.println(word2); String junk = keyboard1.nextLine(); //To get rid of rest of line. 18 19 20 System.out.println("Reenter the same line of text:"); 21 word1 = keyboard2.next(); 22 word2 = keyboard2.next(); 23 System.out.println("For keyboard2 the two words read are:"); 24 System.out.println(word1); 25 System.out.println(word2); 26 27 }

Introduction to File Input/Output

- The Scanner class can also be used to read from files on the disk
- Here we only present the basic structure of reading from text files
 - Some keywords are introduced without full explanation
 - More detail in Chapter 10
 - By covering the basics here your programs can work with real-world data that would otherwise be too much work to type into your program every time it is run

Text Input

• Import the necessary classes in addition to scanner

```
import java.io.FileInputStream;
import java.io.FileNotFoundException;
```

- Open the file inside a try/catch block
 - If an error occurs while trying to open the file then execution jumps to the catch block
 - This is discussed in more detail in Chapter 9
- Use nextInt(), nextLine(), etc. to read from the Scanner like reading from the console, except the input comes from the file

Try/Catch Block

import java.util.Scanner;
    import java.io.FileInputStream;
    import java.io.FileNotFoundException;
    public class TextFileDemo
      public static void main(String[] args)
         Scanner fileIn = null; // Initializes fileIn to empty
                                                                  try and catchis
11
                                                                    kplained in more
12
            // Attempt to open the file
13
            fileIn = new Scanner(
14
               new FileInputStream("player.txt"));
                                                                  The file player.
15
                                                                 txt should be in the
         catch (FileNotFoundException e)
                                                                  same directory as
17
                                                                  the Java program.
           // This block executed if the file is not found
                                                                 You can also supply
19
           // and then the program exits
                                                                 a full pathname
20
           System.out.println("File not found.");
21
           System.exit(0);
```

Program to Read a Text File

```
// If the program gets here then
25
           // the file was opened successfully
26
           int highscore;
           String name;
29
           System.out.println("Text left to read? " +
               fileIn.hasNextLine());
30
31
           highscore = fileIn.nextInt();
           fileIn.nextLine(); // Read newline left from nextInt()
32
33
           name = fileIn.nextLine();
