

Cameras

Digital Visual Effects

Yung-Yu Chuang

with slides by Fredo Durand, Brian Curless, Steve Seitz and Alexei Efros

Camera trial #1

Put a piece of film in front of an object.

Pinhole camera

Add a barrier to block off most of the rays.

- It reduces blurring
- The pinhole is known as the aperture
- The image is inverted

Shrinking the aperture

Why not making the aperture as small as possible?

- Less light gets through
- Diffraction effect

Shrinking the aperture

2 mm

1 mm

0.6mm

0.35 mm

0.15 mm

Adding a lens

A lens focuses light onto the film

- There is a specific distance at which objects are "in focus"
- other points project to a "circle of confusion" in the image

Lenses

Thin lens equation: $\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f}$

- Any object point satisfying this equation is in focus
- Thin lens applet:

http://www.phy.ntnu.edu.tw/java/Lens/lens_e.html

$$y'/y = D'/D$$

Thin lens formula

Similar triangles everywhere! $y'/y = D'/D$

$$y'/y = (D' - f)/f$$

Thin lens formula

$$\frac{1}{D'} + \frac{1}{D} = \frac{1}{f}$$

The focal length f determines the lens's ability to bend (refract) light. It is a function of the shape and index of refraction of the lens.

Zoom lens

200mm

28mm

simplified zoom lens
in operation

From wikipedia

Nikkor 28-200mm zoom lens.

Field of view vs focal length

Gaussian Lens Formula:
$$\frac{1}{i} + \frac{1}{o} = \frac{1}{f}$$

Field of View:
$$\alpha = 2\arctan(w/(2i)) \approx 2\arctan(w/(2f))$$

Example: $w = 30\text{mm}$, $f = 50\text{mm} \Rightarrow \alpha \approx 33.4^\circ$

Focal length in practice

(50mm)

telephoto
($> 200\text{mm}$)

Distortion

- Radial distortion of the image
 - Caused by imperfect lenses
 - Deviations are most noticeable for rays that pass through the edge of the lens

Correcting radial distortion

Slides from Li Zhang

Chromatic Aberration

Lens has different refractive indices for different wavelengths.

Special lens systems using two or more pieces of glass with different refractive indexes can reduce or eliminate this problem.

http://www.dpreview.com/learn/?/Glossary/Optical/chromatic_aberration_01.htm

Exposure = aperture + shutter speed

- Aperture of diameter D restricts the range of rays (aperture may be on either side of the lens)
- Shutter speed is the amount of time that light is allowed to pass through the aperture

Exposure

- Two main parameters:
 - Aperture (in f stop)

Full aperture

Medium aperture

Stopped down

- Shutter speed (in fraction of a second)

Blade (closing)

Blade (open)

Focal plane (closed)

Focal plane (open)

Effects of shutter speeds

- Slower shutter speed => more light, but more motion blur

Slow shutter speed

Fast shutter speed

- Faster shutter speed freezes motion

From Photography, London et al.

Walking people

1/125

Running people

1/250

Car

1/500

Fast train

1/1000

Aperture

- Aperture is the diameter of the lens opening, usually specified by f-stop, f/D , a fraction of the focal length.
 - $f/2.0$ on a 50mm means that the aperture is 25mm
 - $f/2.0$ on a 100mm means that the aperture is 50mm
- When a change in f-stop occurs, the light is either doubled or cut in half.
- Lower f-stop, more light (larger lens opening)
- Higher f-stop, less light (smaller lens opening)

Depth of field

Changing the aperture size affects depth of field. A smaller aperture increases the range in which the object is approximately in focus

Depth of field

Changing the aperture size affects depth of field. A smaller aperture increases the range in which the object is approximately in focus

Depth of field

LESS DEPTH OF FIELD

Wider aperture

MORE DEPTH OF FIELD

Smaller aperture

Exposure

- Two main parameters:
 - Aperture (in f stop)
 - Shutter speed (in fraction of a second)
- Reciprocity
 - The same exposure is obtained with an exposure twice as long and an aperture *area* half as big
 - Hence square root of two progression of f stops vs. power of two progression of shutter speed
 - Reciprocity can fail for very long exposures

From Photography, London et al.

Reciprocity

- Assume we know how much light we need
- We have the choice of an infinity of shutter speed/aperture pairs

- What will guide our choice of a shutter speed?
 - Freeze motion vs. motion blur, camera shake
- What will guide our choice of an aperture?
 - Depth of field, diffraction limit
- Often we must compromise
 - Open more to enable faster speed (but shallow DoF)

Exposure & metering

- The camera metering system measures how bright the scene is
- In Aperture priority mode, the photographer sets the aperture, the camera sets the shutter speed
- In Shutter-speed priority mode, photographers sets the shutter speed and the camera deduces the aperture
- In Program mode, the camera decides both exposure and shutter speed (middle value more or less)
- In Manual mode, the user decides everything (but can get feedback)

Pros and cons of various modes

- Aperture priority
 - Direct depth of field control
 - Cons: can require impossible shutter speed (e.g. with f/1.4 for a bright scene)
- Shutter speed priority
 - Direct motion blur control
 - Cons: can require impossible aperture (e.g. when requesting a 1/1000 speed for a dark scene)
 - Note that aperture is somewhat more restricted
- Program
 - Almost no control, but no need for neurons
- Manual
 - Full control, but takes more time and thinking

Sensitivity (ISO)

- Third variable for exposure
- Linear effect (200 ISO needs half the light as 100 ISO)
- Film photography: trade sensitivity for grain

Kodachrome 25 ASA

Ektachrome 64 ASA

Fujichrome 100 ASA

Ektachrome 200 ASA

- Digital photography: trade sensitivity for noise

lens &
motor

aperture
& shutter

film

Digital camera

- A digital camera replaces film with a sensor array
- Each cell in the array is a light-sensitive diode that converts photons to electrons

CCD v.s. CMOS

- CCD is less susceptible to noise (special process, higher fill factor)
- CMOS is more flexible, less expensive (standard process), less power consumption

CCD

CMOS

Sensor noise

- Blooming
- Diffusion
- Dark current
- Photon shot noise
- Amplifier readout noise

Blooming

SLR (Single-Lens Reflex)

- Reflex (R in SLR) means that we see through the same lens used to take the image.
- Not the case for compact cameras

SLR view finder

Color

So far, we've only talked about monochrome sensors. Color imaging has been implemented in a number of ways:

- Field sequential
- Multi-chip
- Color filter array
- X3 sensor

Field sequential

Field sequential
