Linked List for Sparse Vectors

Application: Sparse Vector in Scientific Computing

$$[3, 5, -1, 9, 2, -4, -5]$$

Engineering

$$[0, 0, \underline{6}, 0, \underline{4}, 0, 0]$$

$$\uparrow$$

$$(3, 6)$$

$$\uparrow$$

$$(5, 4)$$

$$6 \cdot x^3$$

$$4 \cdot x^5$$

polynomial: can be viewed as special case of sparse vector

Sparse Vector: (Dense) Array versus Linked List

$$\begin{array}{ccccccc}
 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
 [& 0 & , & 0 & , & 6 & , & 0 & , & 4 & , & 0 & , & 0 &]
 \end{array}$$

$$\rightarrow (\underline{3}, 6) \rightarrow (\underline{5}, 4) \rightarrow$$

 "ordered"

storing only non-zeros can be time/space efficient

Merging Sparse Vectors $c1 = c1 \rightarrow \text{next}$;

Q: algorithm for "merging" sparse vectors

```

while(!c1->end() && !c2->end()){
  if(c1->order < c2->order){
    res.insert_back(c1); c1++;
  }
  else if (c1->order > c2->order){
    res.insert_back(c2); c2++;
  }
  else{
    res.insert_back(c1 "+" c2); c1++; c2++;
  }
}

```

"running cursors" algorithm:
 insert back others
 similar for other uses, like dot product

Real-World Usage of Sparse Vector: LIBSVM

```
1  double Kernel::dot(const svm_node *px, const svm_node *py){
2      double sum = 0;
3      while(px->index != -1 && py->index != -1){
4          if(px->index == py->index){
5              sum += px->value * py->value;
6              ++px;
7              ++py;
8          }
9          else{
10             if(px->index > py->index)
11                 ++py;
12             else
13                 ++px;
14         }
15     }
16     return sum;
17 }
```

good data structure needed everywhere

Linked List in Job Interviews

Linked List Reversal

nothing special, but important to “code on board”

“Cycle” in Linked List?

tortoise-hare (turtle-rabbit) algorithm

Middle of Linked List

$$N + \frac{N}{2}$$

two pass, or tortoise-hare algorithm
