

Assembly Fundamentals

Computer Organization and Assembly Languages

Yung-Yu Chuang

2006/10/30

with slides by Kip Irvine

Chapter Overview

- Basic Elements of Assembly Language
- Example: Adding and Subtracting Integers
- Assembling, Linking, and Running Programs
- Defining Data
- Symbolic Constants

Basic elements of assembly language

- Integer constants
- Integer expressions
- Character and string constants
- Reserved words and identifiers
- Directives and instructions
- Labels
- Mnemonics and Operands
- Comments
- Examples

Integer constants

- $[\{+|- \}] \textit{ digits } [\textit{radix}]$
- Optional leading + or – sign
- binary, decimal, hexadecimal, or octal digits
- Common radix characters:
 - **h** – hexadecimal
 - **d** – decimal (default)
 - **b** – binary
 - **r** – encoded real
 - **o** – octal

Examples: **30d**, **6Ah**, **42**, **42o**, **1101b**

Hexadecimal beginning with letter: **0A5h**

Integer expressions

- Operators and precedence levels:

Operator	Name	Precedence Level
()	parentheses	1
+, -	unary plus, minus	2
*, /	multiply, divide	3
MOD	modulus	3
+, -	add, subtract	4

- Examples:

Expression	Value
16 / 5	3
-(3 + 4) * (6 - 1)	-35
-3 + 4 * 6 - 1	20
25 mod 3	1

Real number constants (encoded reals)

- Fixed point v.s. floating point

$\pm 1.bbbb \times 2^{(E-127)}$

- Example **3F800000r** = **+1.0, 37.75** = **42170000r**

- double

Real number constants (decimal reals)

- $[sign]integer.[integer][exponent]$

sign $\rightarrow \{+ | -\}$

exponent $\rightarrow E[\{+ | -\}]integer$

- Examples:

2.

+3.0

-44.2E+05

26.E5

Character and string constants

- Enclose character in single or double quotes
 - `'A'`, `"x"`
 - ASCII character = 1 byte
- Enclose strings in single or double quotes
 - `"ABC"`
 - `'xyz'`
 - Each character occupies a single byte
- Embedded quotes:
 - ``Say "Goodnight," Gracie'`
 - `"This isn't a test"`

Reserved words and identifiers

- Reserved words (Appendix D) cannot be used as identifiers
 - Instruction mnemonics, directives, type attributes, operators, predefined symbols
- Identifiers
 - 1-247 characters, including digits
 - case insensitive (by default)
 - first character must be a letter, `_`, `@`, or `$`
 - examples:

<code>var1</code>	<code>Count</code>	<code>\$first</code>
<code>_main</code>	<code>MAX</code>	<code>open_file</code>
<code>@@myfile</code>	<code>xVal</code>	<code>_12345</code>

Directives

- Commands that are recognized and acted upon by the assembler
 - Part of assembler's syntax but not part of the Intel instruction set
 - Used to declare code, data areas, select memory model, declare procedures, etc.
 - case insensitive
- Different assemblers have different directives
 - NASM != MASM, for example
- Examples: **.data** **.code** **PROC**

Instructions

- Assembled into machine code by assembler
- Executed at runtime by the CPU
- Member of the Intel IA-32 instruction set
- Four parts
 - Label (optional)
 - Mnemonic (required)
 - Operand (usually required)
 - Comment (optional)

Label:

Mnemonic

Operand(s)

;Comment

Labels

- Act as place markers
 - marks the address (offset) of code and data
- Easier to memorize and more flexible
`mov ax, [0020] → mov ax, val`
- Follow identifier rules
- Data label
 - must be unique
 - example: `myArray BYTE 10`
- Code label
 - target of jump and loop instructions
 - example: `L1: mov ax, bx`
`...`
`jmp L1`

Mnemonics and operands

- Instruction mnemonics
 - "reminder"
 - examples: **MOV**, **ADD**, **SUB**, **MUL**, **INC**, **DEC**
- Operands
 - constant (immediate value), **96**
 - constant expression, **2+4**
 - Register, **eax**
 - memory (data label), **count**
- Number of operands: 0 to 3
 - **stc** ; set Carry flag
 - **inc ax** ; add 1 to ax
 - **mov count, bx** ; move BX to count

Comments

- Comments are good!
 - explain the program's purpose
 - tricky coding techniques
 - application-specific explanations
- Single-line comments
 - begin with semicolon (;)
- block comments
 - begin with COMMENT directive and a programmer-chosen character and end with the same programmer-chosen character

COMMENT !

This is a comment

and this line is also a comment

!

Example: adding/subtracting integers

directive marks comment

TITLE Add and Subtract

(AddSub.asm)

comment

; This program adds and subtracts 32-bit integers.

INCLUDE Irvine32.inc

copy definitions from Irvine32.inc

.code

code segment. 3 segments: code, data, stack

main PROC

beginning of a procedure

mov eax,10000h

source

; EAX = 10000h

add eax,40000h

destination

; EAX = 50000h

sub eax,20000h

; EAX = 30000h

call DumpRegs

; display registers

exit

defined in Irvine32.inc to end a program

main ENDP

END main

mark the last line and
startup procedure

Example output

Program output, showing registers and flags:

EAX=00030000	EBX=7FFDF000	ECX=00000101	EDX=FFFFFFFF
ESI=00000000	EDI=00000000	EBP=0012FFF0	ESP=0012FFC4
EIP=00401024	EFL=00000206	CF=0	SF=0 ZF=0 OF=0

Suggested coding standards (1 of 2)

- Some approaches to capitalization
 - capitalize nothing
 - capitalize everything
 - capitalize all reserved words, including instruction mnemonics and register names
 - capitalize only directives and operators (used by the book)
- Other suggestions
 - descriptive identifier names
 - spaces surrounding arithmetic operators
 - blank lines between procedures

Suggested coding standards (2 of 2)

- Indentation and spacing
 - code and data labels – no indentation
 - executable instructions – indent 4-5 spaces
 - comments: begin at column 40-45, aligned vertically
 - 1-3 spaces between instruction and its operands
 - ex: `mov ax,bx`
 - 1-2 blank lines between procedures

Alternative version of AddSub

```
TITLE Add and Subtract                                (AddSubAlt.asm)

; This program adds and subtracts 32-bit integers.
.386
.MODEL flat,stdcall
.STACK 4096

ExitProcess PROTO, dwExitCode:DWORD
DumpRegs PROTO

.code
main PROC
    mov eax,10000h                ; EAX = 10000h
    add eax,40000h                ; EAX = 50000h
    sub eax,20000h                ; EAX = 30000h
    call DumpRegs
    INVOKE ExitProcess,0
main ENDP
END main
```

Program template

```
TITLE Program Template                                (Template.asm)

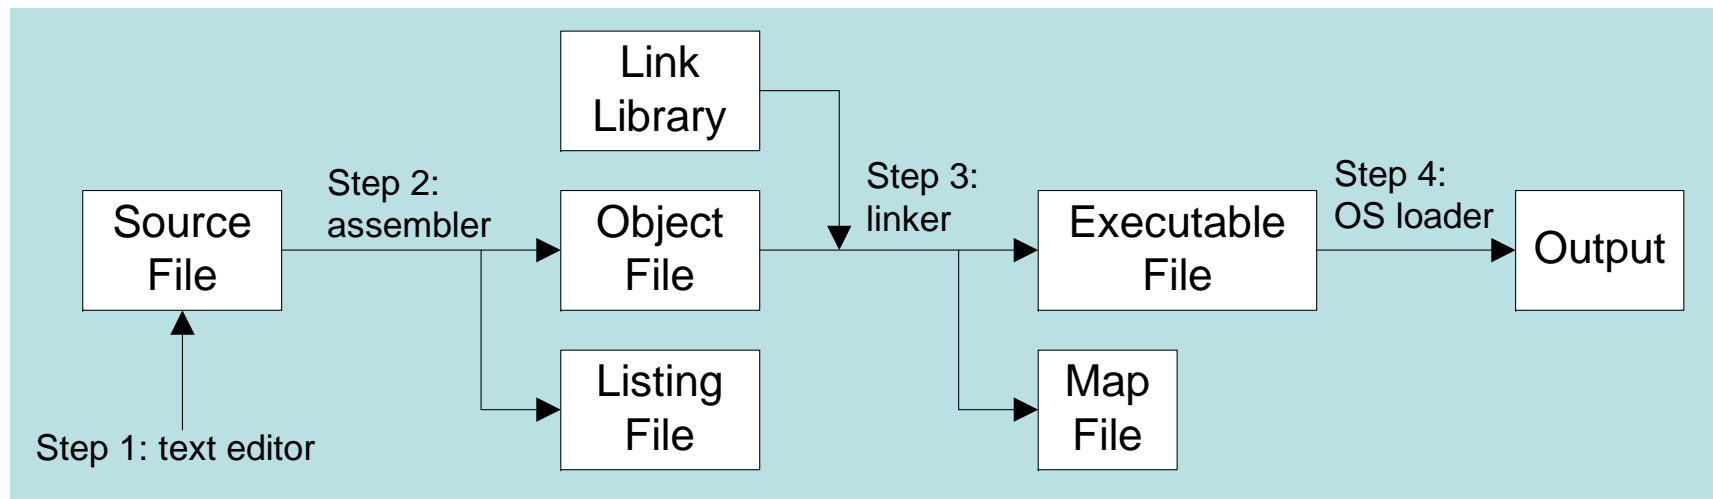

; Program Description:
; Author:
; Creation Date:
; Revisions:
; Date:                Modified by:

INCLUDE Irvine32.inc
.data
    ; (insert variables here)
.code
main PROC
    ; (insert executable instructions here)
    exit
main ENDP
    ; (insert additional procedures here)
END main
```

Assemble-link execute cycle

- The following diagram describes the steps from creating a source program through executing the compiled program.
- If the source code is modified, Steps 2 through 4 must be repeated.

Listing file

- Use it to see how your program is compiled
- Contains
 - source code
 - addresses
 - object code (machine language)
 - segment names
 - symbols (variables, procedures, and constants)
- Example: [addSub.lst](#)

Defining data

- Intrinsic data types
- Data Definition Statement
- Defining BYTE and SBYTE Data
- Defining WORD and SWORD Data
- Defining DWORD and SDWORD Data
- Defining QWORD Data
- Defining TBYTE Data
- Defining Real Number Data
- Little Endian Order
- Adding Variables to the AddSub Program
- Declaring Uninitialized Data

Intrinsic data types (1 of 2)

- **BYTE, SBYTE**
 - 8-bit unsigned integer; 8-bit signed integer
- **WORD, SWORD**
 - 16-bit unsigned & signed integer
- **DWORD, SDWORD**
 - 32-bit unsigned & signed integer
- **QWORD**
 - 64-bit integer
- **TBYTE**
 - 80-bit integer

Intrinsic data types (2 of 2)

- **REAL4**
 - 4-byte IEEE short real
- **REAL8**
 - 8-byte IEEE long real
- **REAL10**
 - 10-byte IEEE extended real

Data definition statement

- A data definition statement sets aside storage in memory for a variable.
- May optionally assign a name (label) to the data.
- Only size matters, other attributes such as signed are just reminders for programmers.
- Syntax:
 `[name] directive initializer [, initializer] . . .`
 At least one initializer is required, can be ?
- All initializers become binary data in memory

Defining BYTE and SBYTE Data

Each of the following defines a single byte of storage:

```
value1 BYTE 'A'      ; character constant
value2 BYTE 0         ; smallest unsigned byte
value3 BYTE 255       ; largest unsigned byte
value4 SBYTE -128     ; smallest signed byte
value5 SBYTE +127     ; largest signed byte
value6 BYTE ?         ; uninitialized byte
```

A variable name is a data label that implies an offset (an address).

The diagram illustrates a computer system architecture. At the top left is a box labeled 'CPU' containing two smaller boxes labeled 'ADD' and 'SUB'. To the right of the CPU is a box labeled 'Memory'. Below the CPU and Memory is a horizontal line representing the 'Data bus'. Below the Data bus is another horizontal line representing the 'Address bus'. Below the Address bus is a third horizontal line representing the 'Control bus'. At the bottom is a box labeled 'Ports'. The CPU is connected to the Memory, Data bus, Address bus, and Control bus. The Memory is connected to the Data bus and Address bus. The Ports are connected to the Data bus, Address bus, and Control bus.

[illegible]

```
list4 BYTE 0Ah,20h,'A',22h
```

Defining strings (1 of 2)

- A string is implemented as an array of characters
 - For convenience, it is usually enclosed in quotation marks
 - It usually has a null byte at the end
- Examples:

```
str1 BYTE "Enter your name",0
str2 BYTE 'Error: halting program',0
str3 BYTE 'A','E','I','O','U'
greeting1 BYTE "Welcome to the Encryption Demo program "
            BYTE "created by Kip Irvine.",0
greeting2 \
    BYTE "Welcome to the Encryption Demo program "
    BYTE "created by Kip Irvine.",0
```

Defining strings (2 of 2)

- End-of-line character sequence:
 - 0Dh = carriage return
 - 0Ah = line feed

```
str1 BYTE "Enter your name:      ",0Dh,0Ah
      BYTE "Enter your address: ",0

newLine BYTE 0Dh,0Ah,0
```

Idea: Define all strings used by your program in the same area of the data segment.

Using the DUP operator

- Use **DUP** to allocate (create space for) an array or string.
- Counter and argument must be constants or constant expressions

```
var1 BYTE 20 DUP(0) ; 20 bytes, all zero
var2 BYTE 20 DUP(?) ; 20 bytes,
                    ; uninitialized
var3 BYTE 4 DUP("STACK") ; 20 bytes:
                        ; "STACKSTACKSTACKSTACK"
var4 BYTE 10,3 DUP(0),20
```

Defining WORD and SWORD data

- Define storage for 16-bit integers
 - or double characters
 - single value or multiple values

```
word1 WORD    65535    ; largest unsigned
word2 SWORD   -32768    ; smallest signed
word3 WORD     ?        ; uninitialized,
                        ; unsigned
word4 WORD    "AB"      ; double characters
myList WORD   1,2,3,4,5 ; array of words
array WORD    5 DUP(?)  ; uninitialized array
```

Defining DWORD and SDWORD data

Storage definitions for signed and unsigned 32-bit integers:

```
val1 DWORD 12345678h      ; unsigned
val2 SDWORD -2147483648    ; signed
val3 DWORD 20 DUP(?)       ; unsigned array
val4 SDWORD -3,-2,-1,0,1   ; signed array
```

Defining QWORD, TBYTE, Real Data

Storage definitions for quadwords, tenbyte values, and real numbers:

```
quad1 QWORD 1234567812345678h
val1 TBYTE 1000000000123456789Ah
rVal1 REAL4 -2.1
rVal2 REAL8 3.2E-260
rVal3 REAL10 4.6E+4096
ShortArray REAL4 20 DUP(0.0)
```

Little Endian order

- All data types larger than a byte store their individual bytes in reverse order. The least significant byte occurs at the first (lowest) memory address.

- Example:

val1 DWORD 12345678h

0000:	78
0001:	56
0002:	34
0003:	12

Adding variables to AddSub

```
TITLE Add and Subtract, (AddSub2.asm)
INCLUDE Irvine32.inc

.data
val1 DWORD 10000h
val2 DWORD 40000h
val3 DWORD 20000h
finalVal DWORD ?

.code
main PROC
    mov eax, val1           ; start with 10000h
    add eax, val2           ; add 40000h
    sub eax, val3           ; subtract 20000h
    mov finalVal, eax       ; store the result (30000h)
    call DumpRegs          ; display the registers
    exit
main ENDP
END main
```

Declaring uninitialized data

- Use the **.data?** directive to declare an uninitialized data segment:
.data?
- Within the segment, declare variables with "?" initializers: (will not be assembled into .exe)

Advantage: the program's EXE file size is reduced.

```
.data
```

```
smallArray DWORD 10 DUP(0)
```

```
.data?
```

```
bigArray DWORD 5000 DUP(?)
```

Mixing code and data

`.code`

`mov eax, ebx`

`.data`

`temp DWORD ?`

`.code`

`mov temp, eax`

Symbolic constants

- Equal-Sign Directive
- Calculating the Sizes of Arrays and Strings
- EQU Directive
- TEXTEQU Directive

Equal-sign directive

- *name = expression*
 - expression is a **32-bit integer** (expression or constant)
 - may be redefined
 - *name* is called a symbolic constant
- good programming style to use symbols

- Easier to modify
- Easier to understand, **ESC_key**

```
Array DWORD COUNT DUP(0)
```

```
COUNT=5
```

```
mov al, COUNT
```

```
COUNT=10
```

```
mov al, COUNT
```

```
COUNT = 500
```

```
•
```

```
mov al,COUNT
```

Calculating the size of a byte array

- current location counter: \$
 - subtract address of list
 - difference is the number of bytes

```
list BYTE 10,20,30,40  
ListSize = 4
```

```
list BYTE 10,20,30,40  
ListSize = ($ - list)
```

```
list BYTE 10,20,30,40  
Var2 BYTE 20 DUP(?)  
ListSize = ($ - list)
```

```
myString BYTE "This is a long string."  
myString_len = ($ - myString)
```

Calculating the size of a word array

- current location counter: $\$$
 - subtract address of list
 - difference is the number of bytes
 - divide by 2 (the size of a word)

```
list WORD 1000h,2000h,3000h,4000h  
ListSize = ($ - list) / 2
```

```
list DWORD 1,2,3,4  
ListSize = ($ - list) / 4
```

EQU directive

- name EQU expression
name EQU symbol
name EQU <text>
- Define a symbol as either an integer or text expression.
- Can be useful for non-integer constant
- Cannot be redefined

EQU directive

```
PI EQU <3.1416>
pressKey EQU <"Press any key to continue...",0>
.data
prompt BYTE pressKey
```

```
Matrix1 EQU 10*10
matrix1 EQU <10*10>
.data
M1 WORD matrix1          ; M1 WORD 100
M2 WORD matrix2          ; M2 WORD 10*10
```

TEXT EQU directive

- name TEXT EQU <text>
name TEXT EQU textmacro
name TEXT EQU %constExpr
- Define a symbol as either an integer or text expression.
- Called a text macro; can build on each other
- Can be redefined

```
continueMsg TEXT EQU <"Do you wish to continue (Y/N)?">
rowSize = 5
.data
prompt1 BYTE continueMsg
count TEXT EQU %(rowSize * 2); evaluates the expression
move TEXT EQU <mov>
setupAL TEXT EQU <move al,count>
.code
setupAL ; generates: "mov al,10"
```

Chapter recap

- Basic Elements of Assembly Language
- Example: Adding and Subtracting Integers
- Assembling, Linking, and Running Programs
- Defining Data
- Symbolic Constants

Instruction Format Examples

- No operands
 - stc ; set Carry flag
- One operand
 - inc eax ; register
 - inc myByte ; memory
- Two operands
 - add ebx,ecx ; register, register
 - sub myByte,25 ; memory, constant
 - add eax,36 * 25 ; register, expression

Real-Address Mode Programming (1 of 2)

- Generate 16-bit MS-DOS Programs
- Advantages
 - enables calling of MS-DOS and BIOS functions
 - no memory access restrictions
- Disadvantages
 - must be aware of both segments and offsets
 - cannot call Win32 functions (Windows 95 onward)
 - limited to 640K program memory

Real-Address Mode Programming (2 of 2)

- Requirements
 - INCLUDE Irvine16.inc
 - Initialize DS to the data segment:

```
mov ax,@data  
mov ds,ax
```

Add and Subtract, 16-Bit Version

```
TITLE Add and Subtract, Version 2          (AddSub2.asm)
INCLUDE Irvine16.inc
.data
val1 DWORD 10000h
val2 DWORD 40000h
val3 DWORD 20000h
finalVal DWORD ?
.code
main PROC
    mov ax,@data                ; initialize DS
    mov ds,ax
    mov eax,val1                ; get first value
    add eax,val2                ; add second value
    sub eax,val3                ; subtract third value
    mov finalVal,eax            ; store the result
    call DumpRegs               ; display registers
    exit
main ENDP
END main
```

Map file

- Information about each program segment:
 - starting address
 - ending address
 - size
 - segment type
- Example: [addSub.map](#)

make32.bat

- Called a batch file
- Run it to assemble and link programs
- Contains a command that executes ML.EXE (the Microsoft Assembler)
- Contains a command that executes LINK32.EXE (the 32-bit Microsoft Linker)
- Command-Line syntax:
 `make32 progName`
 (*progName* includes the .asm extension)

(use make16.bat to assemble and link Real-mode programs)
