Building a Modern Computer From First Principles

www.nand2tetris.org

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 1

Where we are at:

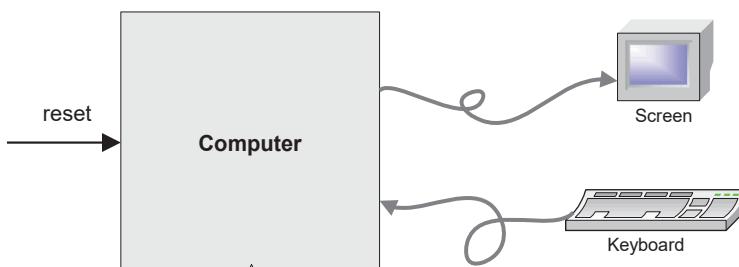

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 2

The Hack computer

A 16-bit machine consisting of the following elements:

The program is stored in a ROM.

The A-instruction

symbolic

`@value`

- `value` is a non-negative decimal number $\leq 2^{15}-1$ or
- A symbol referring to such a constant

binary

`0value`

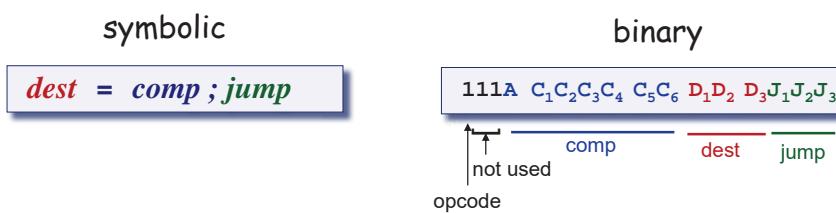

- `value` is a 15-bit binary number

Example

`@21`

`0000 0000 0001 0101`

The C-instruction

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org , Chapter 5: Computer Architecture

slide 5

The C-instruction

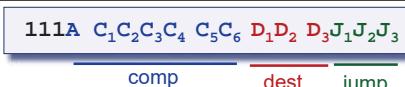

111A C₁C₂C₃C₄ C₅C₆ D₁D₂ D₃J₁J₂J₃
comp
dest
jump

(when a=0)		comp					(when a=1)

Hack assembler
or CPU emulator

assembly code v.s. machine code

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 9

The Hack computer

- A 16-bit stored program platform
- The *instruction memory* and the *data memory* are physically separate
- Screen: 512 rows by 256 columns, black and white
- Keyboard: standard
- Designed to execute programs written in the Hack machine language
- Can be easily built from the chip-set that we built so far in the course

Main parts of the Hack computer:

- Instruction memory (ROM)
- Memory (RAM):
 - Data memory
 - Screen (memory map)
 - Keyboard (memory map)
- CPU
- Computer (the logic that holds everything together).

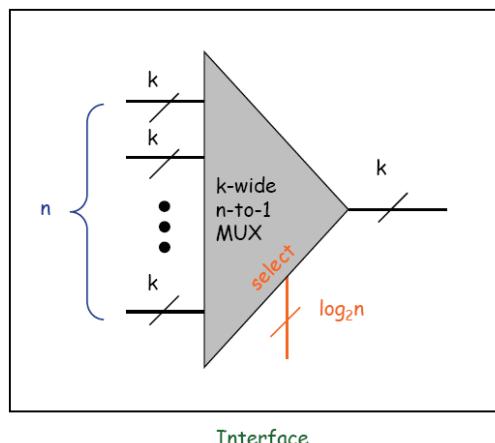

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 10

Multiplexer

Goal: select from one of n k-bit buses

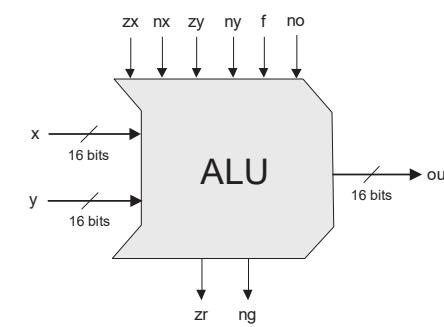

- Implemented by layering k n-to-1 multiplexer

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 11

Hack ALU

```
out(x, y, control bits) =
x+y, x-y, y-x,
0, 1, -1,
x, y, -x, -y,
x!, y!,
x+1, y+1, x-1,
y-1,
x&y, x|y
```

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org, Chapter 5: Computer Architecture

slide 12

Hack ALU

These bits instruct how to preset the x input		These bits instruct how to preset the y input		This bit selects between + / And	This bit inst. how to postset out	Resulting ALU output
zx	nx	zy	ny	f	no	out=
if zx then x=0	if nx then x=x	if zy then y=0	if ny then y!=y	if f then out=x+y else out=x&y	if no then out=!out	f(x,y)=
1	0	1	0	1	0	0
1	1	1	1	1	1	1
1	1	1	0	1	0	-1
0	0	1	1	0	0	x
1	1	0	0	0	0	y
0	0	1	1	0	1	!x
1	1	0	0	0	1	!y
0	0	1	1	1	1	-x
1	1	0	0	1	1	-y
0	1	1	1	1	1	x+1
1	1	0	1	1	1	y+1
0	0	1	1	1	0	x-1
1	1	0	0	1	0	y-1
0	0	0	0	1	0	x+y
0	1	0	0	1	1	x-y
0	0	0	1	1	1	y-x
0	0	0	0	0	0	x&y
0	1	0	1	0	1	x y

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org , Chapter 5: Computer Architecture

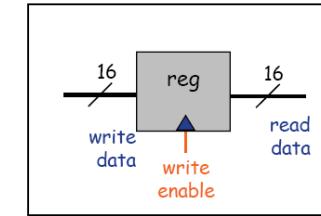

slide 13

Registers

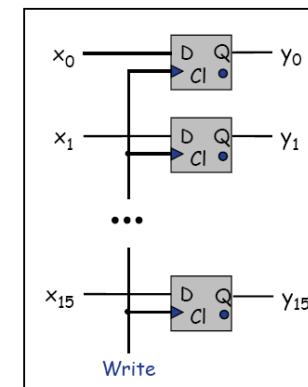

k-bit register.

- Stores k bits.
- Register contents always available on output.
- If write enable is asserted, k input bits get copied into register.

Ex: Program Counter, 16 TOY registers, 256 TOY memory locations.

16-bit Register Interface

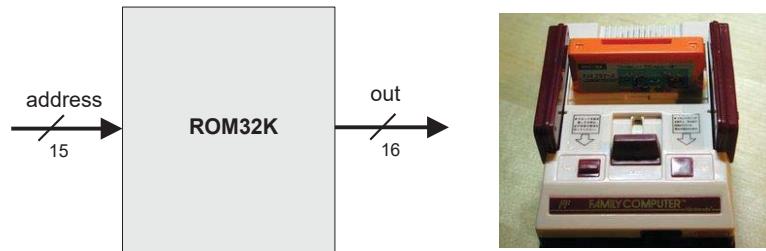

16-bit Register Implementation

Elements of Computing Systems, Nisan & Schocken, MIT Press, www.nand2tetris.org , Chapter 5: Computer Architecture 14

slide 14

ROM (Instruction memory)

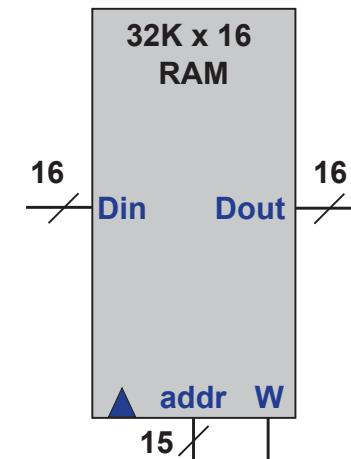

Function:

- The ROM is pre-loaded with a program written in the Hack machine language
 - The ROM chip always emits a 16-bit number:
- ```
out = ROM32K[address]
```
- This number is interpreted as the current instruction.

## RAM (data memory)

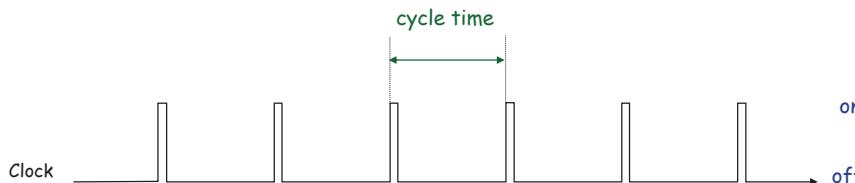

- We will discuss the details for Hack's data memory later.

## Clock

### Clock.

- Fundamental abstraction: regular on-off pulse.
  - on: fetch phase
  - off: execute phase
- External analog device.
- Synchronizes operations of different circuit elements.
- Requirement: clock cycle longer than max switching time.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture 17 slide 17

## Design a processor

### How to build a processor (Hack, this time)

- Develop instruction set architecture (ISA)
  - 16-bit words, two types of machine instructions

- Determine major components
  - ALU, registers, program counter, memory
- Determine datapath requirements
  - Flow of bits
- Analyze how to implement each instruction
  - Determine settings of control signals

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture 18 slide 18

## Hack programming reference card

### Hack commands:

A-command: @value // A<-value; M=RAM[A]

C-command: dest = comp ; jump // dest = and ;jump  
// are optional

Where:

comp =  
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A,  
M, !M, -M, M+1, M-1, D+M, D-M, M-D, D&M, D|M

dest = M, D, A, MD, AM, AD, AMD, or null

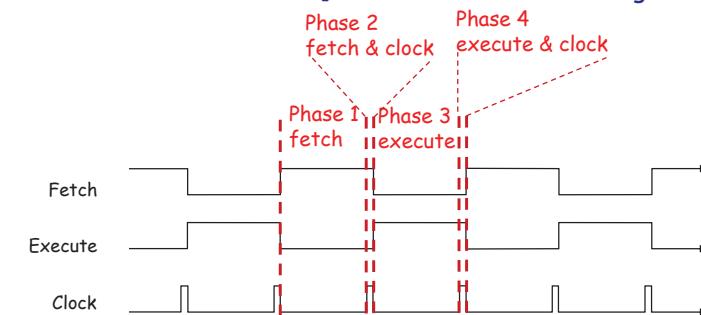

jump = JGT, JEQ, JGE, JLT, JNE, JLE, JMP, or null

In the command dest = comp; jump, the jump materializes (PC<-A) if (comp jump 0) is true. For example, in D=D+1,JLT, we jump if D+1 < 0.

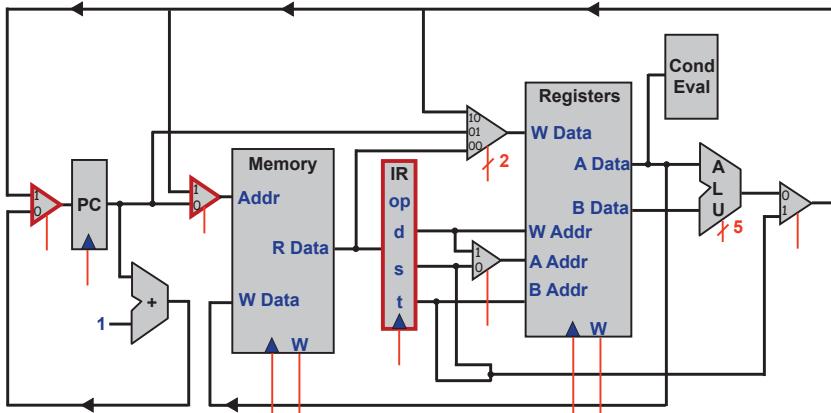

## Fetch and execute

- In Toy, we have two phases: fetch and execution .
- We use two cycles since fetch and execute phases each access memory and alter program counter.

- fetch [set memory address from pc]
- fetch and clock [write instruction to IR]
- execute [set ALU inputs from registers]
- execute and clock [write result of ALU to registers]

## Toy architecture

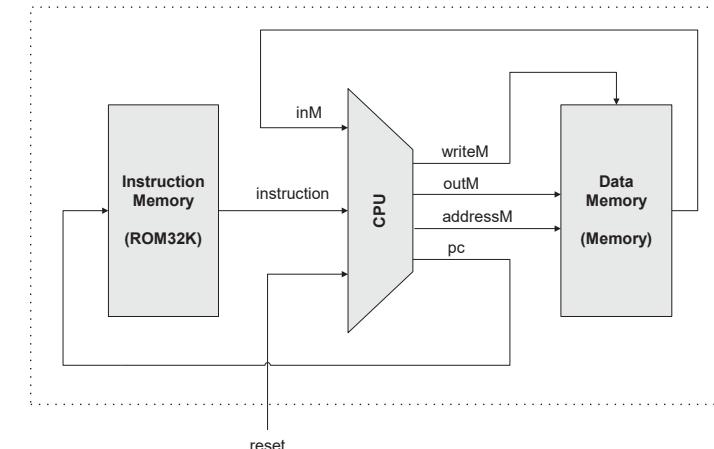

- Both fetch and execute would access memory. To avoid conflict, we add a MUX. Similar for PC.
- In addition, we need a register IR to store the instruction.

21

## Fetch and execute

- In Hack, we avoid two cycles and IR by using two separate memory chips, one for data and the other for instruction.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 22 22

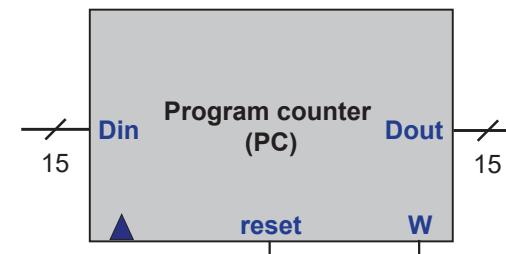

## Design a processor

- How to build a processor (Hack, this time)
  - Develop instruction set architecture (ISA)
    - 16-bit words, two types of machine instructions
  - Determine major components
    - ALU, registers, program counter, memory
  - Determine datapath requirements
    - Flow of bits
  - Analyze how to implement each instruction
    - Determine settings of control signals

23

## Program counter

- Program counter emits the address of the next instruction.
  - To start/restart the program execution:  $PC=0$
  - No jump:  $PC++$
  - Unconditional jump:  $PC=A$
  - Conditional jump: if (cond.)  $PC=A$  else  $PC++$

Note that the design is slightly different from your project #3.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 23 24

## Program counter

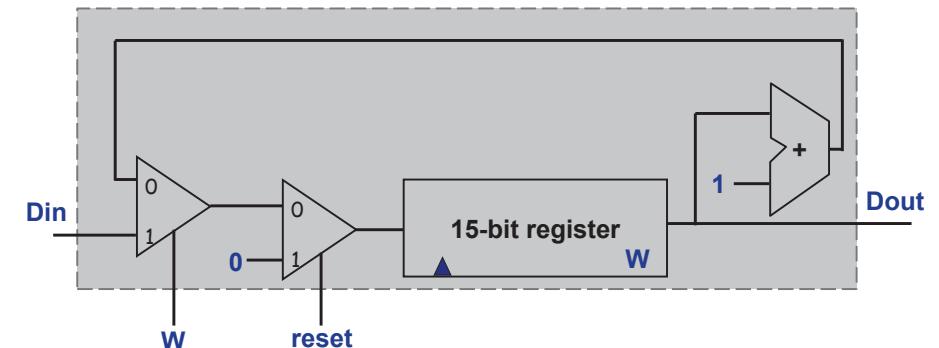

```
if (reset) PC=0
else if (W) PC=Din
else PC++
```

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 25

## Program counter

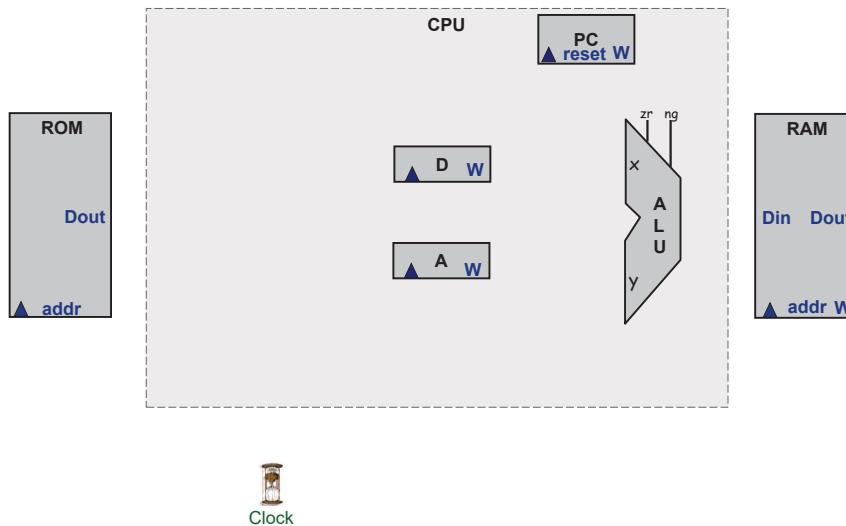

```
if (reset) PC=0
else if (W) PC=Din
else PC++
```

slide 28

## Hack architecture (data path)

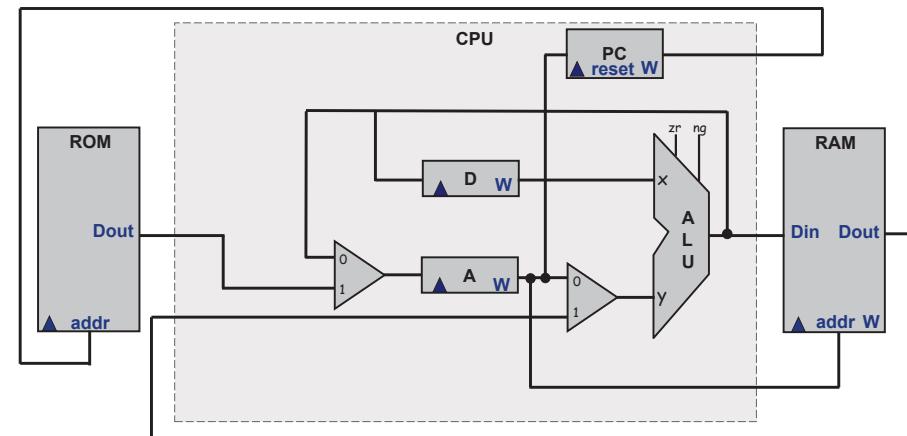

Fetch: instruction=ROM[PC]

@value // A<-value; M=RAM[A]

[ADM] = x op y; jump // x=D; y=A or M; if jump then PC<-A

## Hack architecture (data path)

Fetch: instruction=ROM[PC]

@value // A<-value; M=RAM[A]

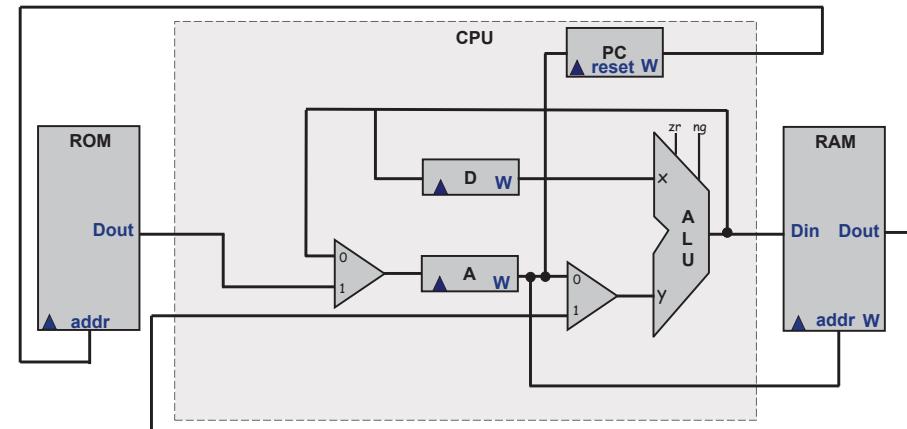

[ADM] = x op y; jump // x=D; y=A or M; if jump then PC<-A

## Design a processor

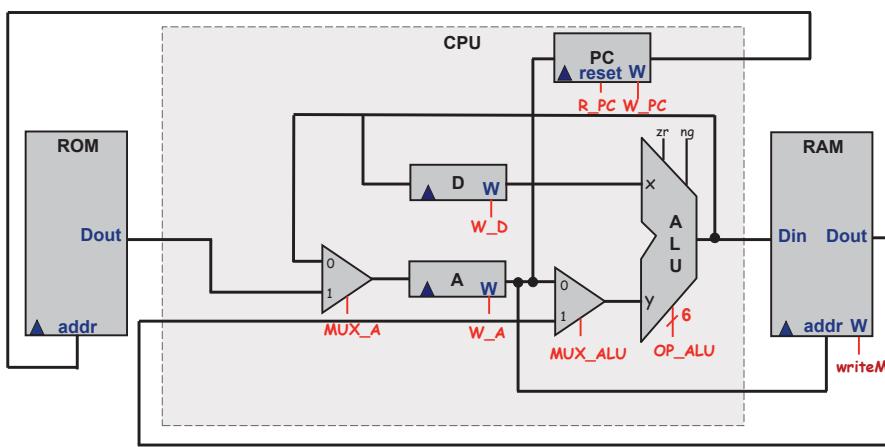

### ■ How to build a processor (Hack, this time)

- Develop instruction set architecture (ISA)
  - 16-bit words, two types of machine instructions
- Determine major components
  - ALU, registers, program counter, memory
- Determine datapath requirements
  - Flow of bits
- ➡ • Analyze how to implement each instruction
  - Determine settings of control signals

## Hack architecture (data path)

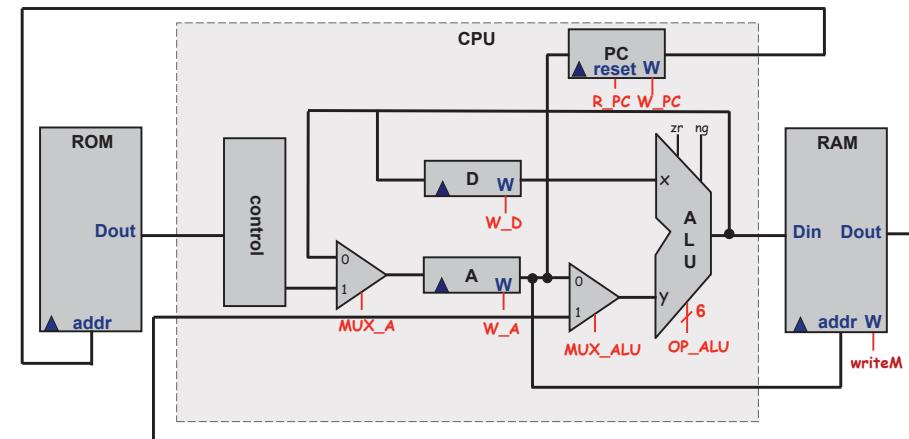

## Hack architecture (control)

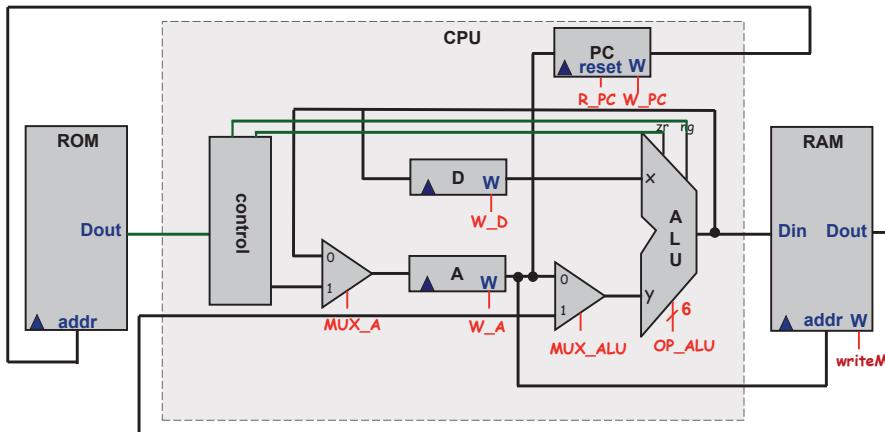

A total of 13 control signals

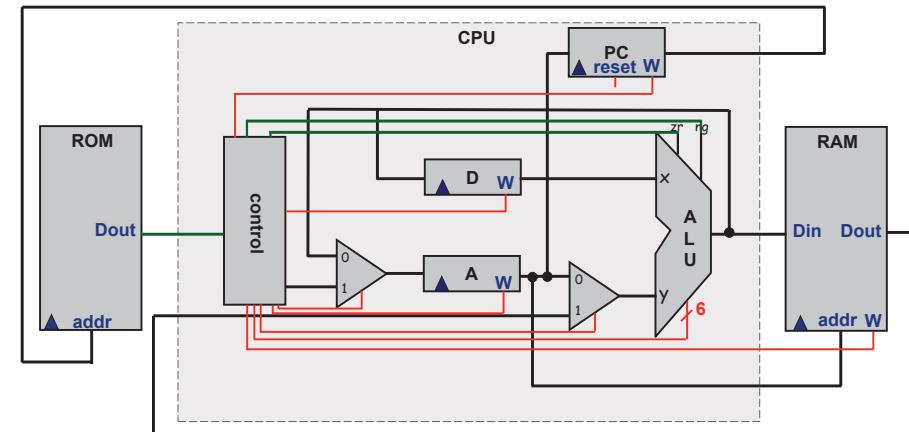

## Hack architecture (control)

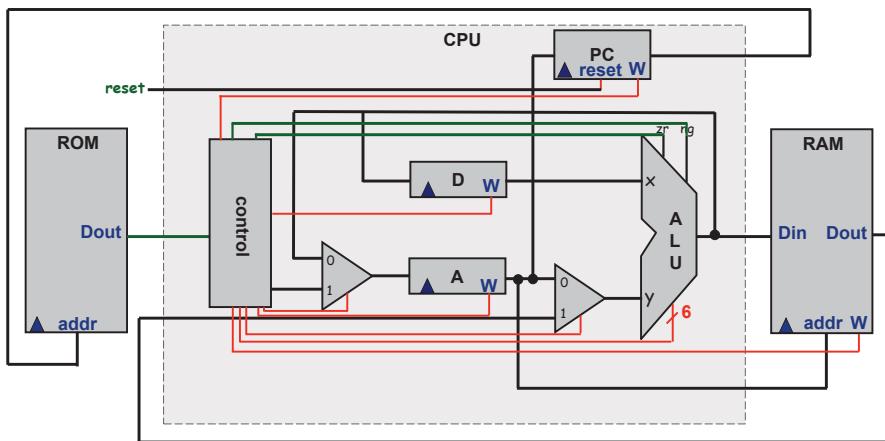

## Hack architecture (control)

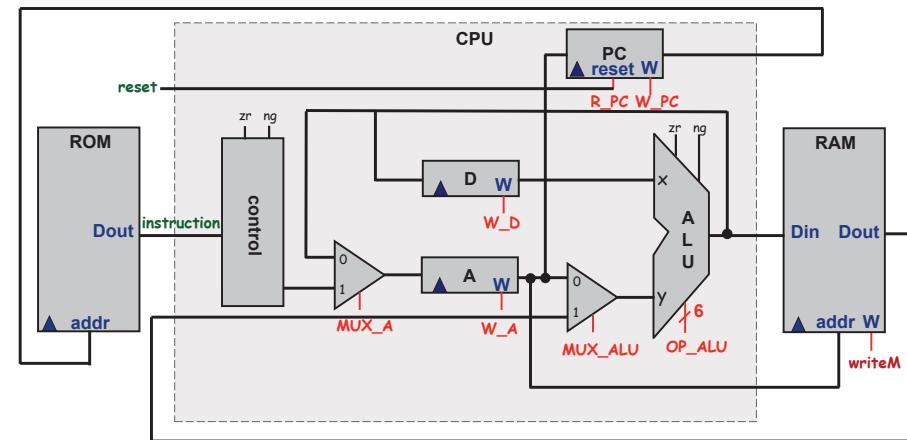

## Hack architecture (control)

## Hack architecture (control)

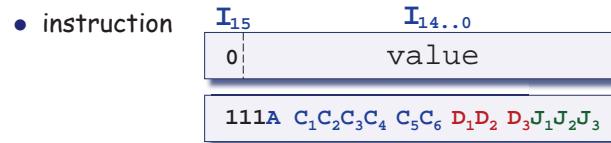

## Hack architecture (control)

## Hack architecture (control)

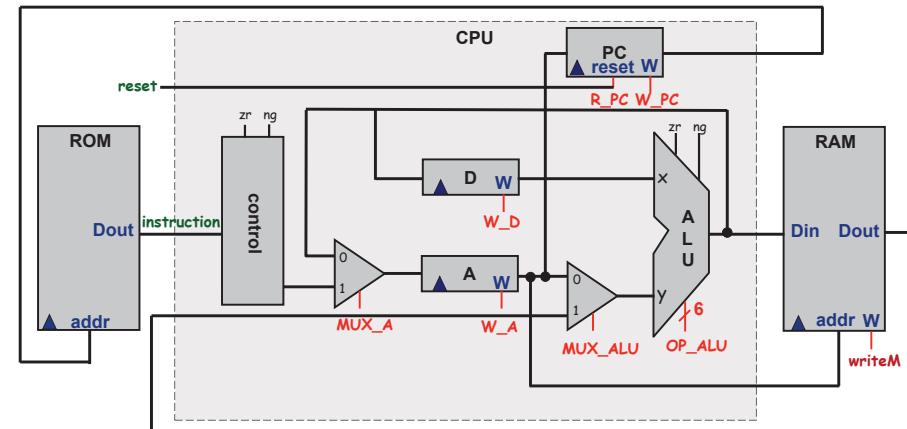

### Inputs: instruction, zr, ng

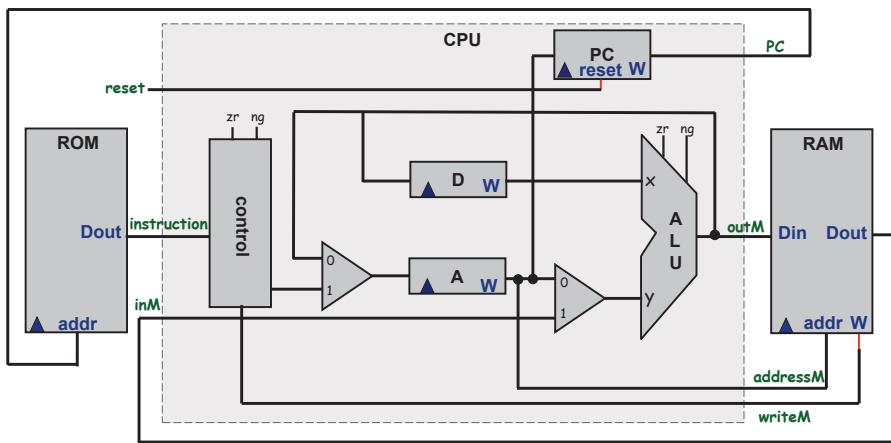

### Outputs:

- OP\_ALU = C<sub>1</sub>C<sub>2</sub>C<sub>3</sub>C<sub>4</sub>C<sub>5</sub>C<sub>6</sub>
- MUX\_A =  $\overline{I_{15}}$
- MUX\_ALU = A
- W\_A = ( $I_{15} \& D_1$ ) +  $\overline{I_{15}}$
- W\_D =  $I_{15} \& D_2$
- writeM =  $I_{15} \& D_3$
- W\_PC =  $I_{15} \& ((J_1 \& ng) + (J_2 \& zr) + (J_3 \& gt))$ ; gt =  $\overline{ng} \& \overline{zr}$

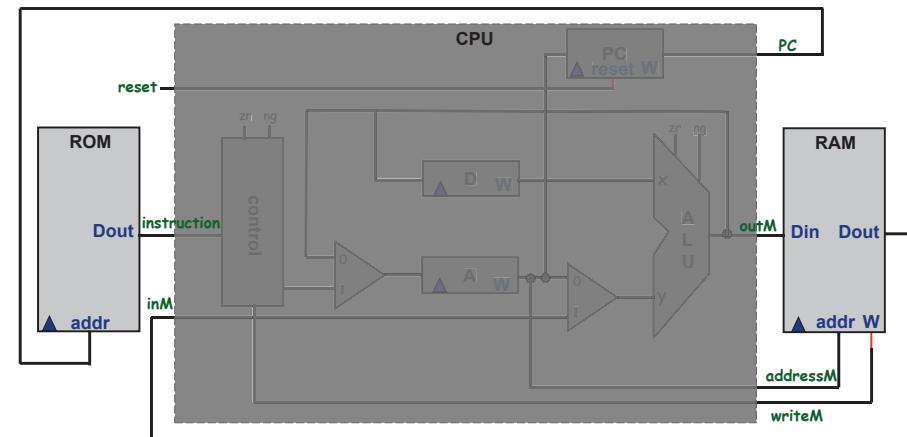

## Hack architecture (trace @10 / D=M+1;JGE )

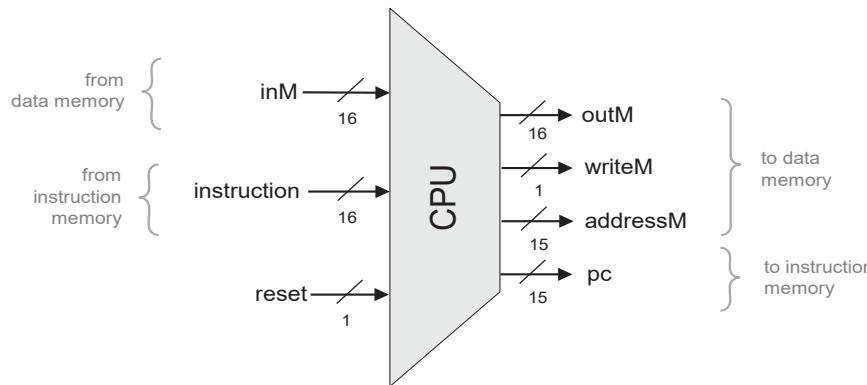

## Hack architecture (CPU interface)

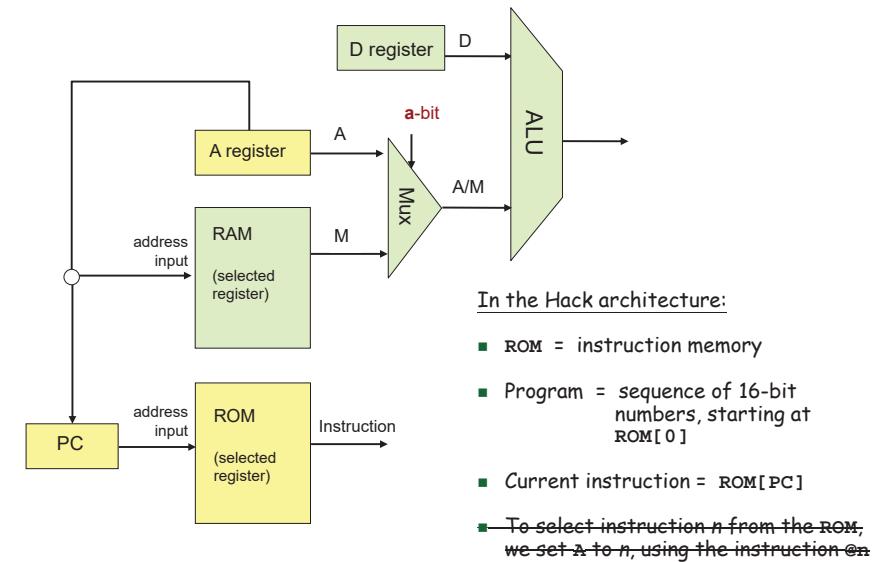

## Hack architecture (CPU interface)

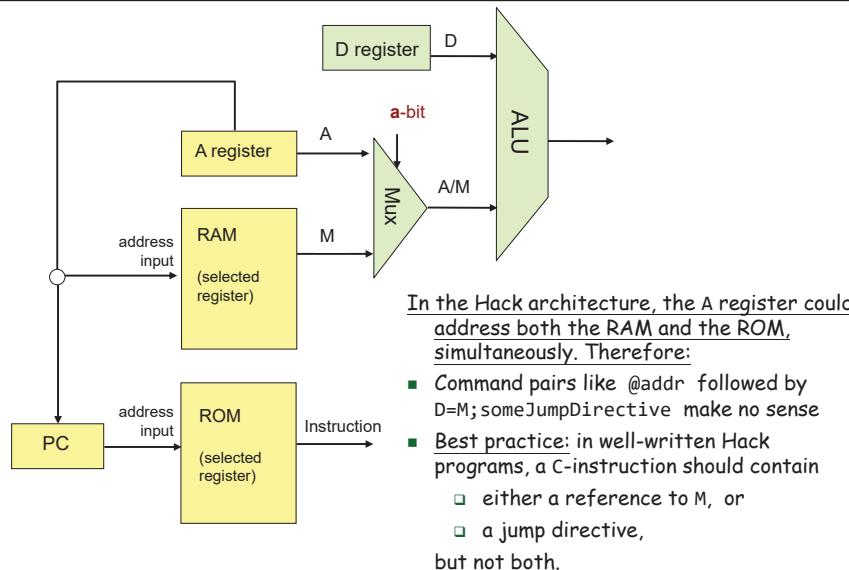

## Hack CPU

## Control (focus on the yellow chips only)

## Side note (focus on the yellow chip parts only)

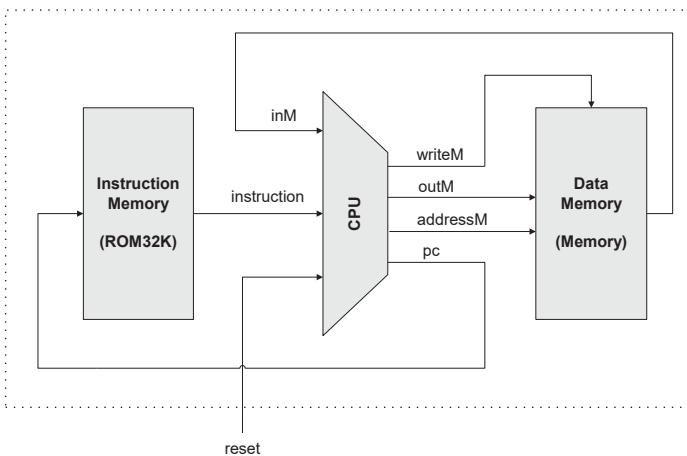

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org) , Chapter 5: Computer Architecture

slide 45

## The Hack computer (put together)

A 16-bit machine consisting of the following elements:

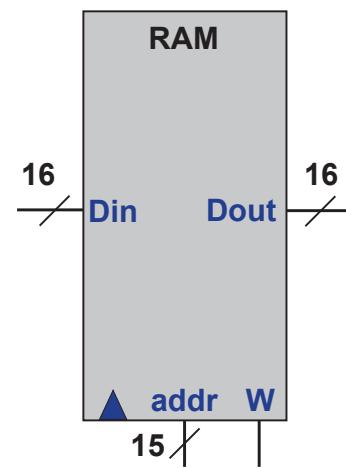

Both memory chips are 16-bit wide and have 15-bit address space.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org) , Chapter 5: Computer Architecture

slide 46

## RAM (data memory)

- The RAM used in Hack is different from a normal RAM. It also plays the role for I/O.
- Programmers usually use high-level library for I/O, such as `printf`, `drawline`.
- But, at low-level, we usually need to manipulate bits directly for I/O.

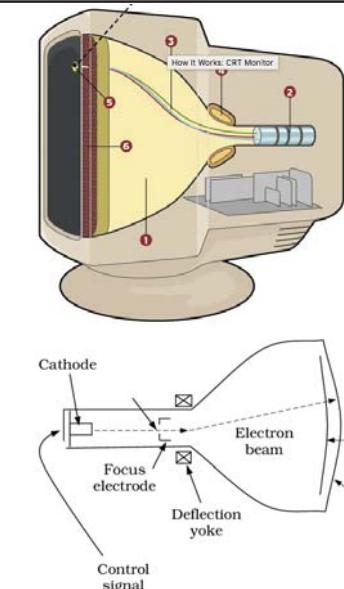

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org) , Chapter 5: Computer Architecture

slide 47

## Displays

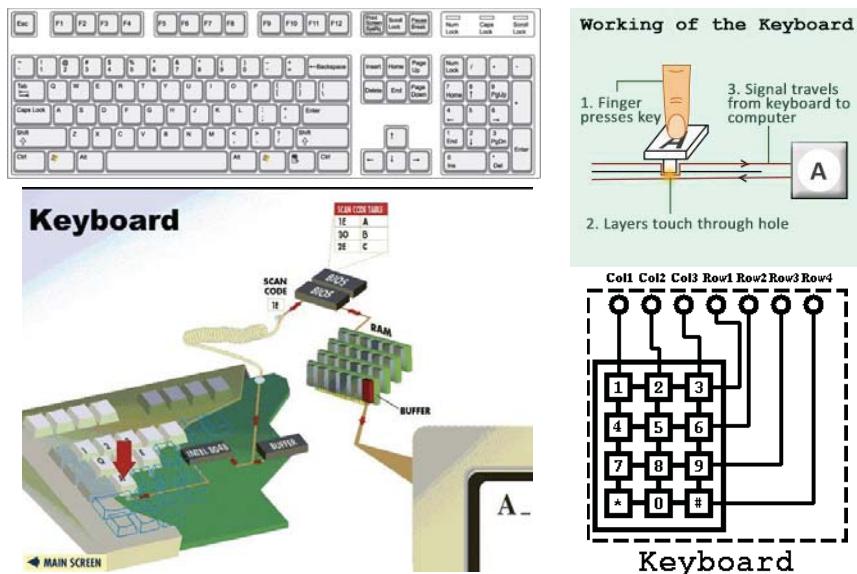

- CRT displays
  - resolution
  - refresh rate

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org) , Chapter 5: Computer Architecture

slide 48

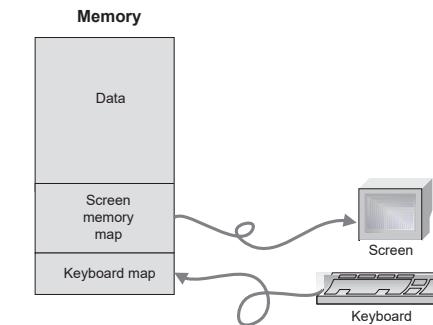

## keyboard

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 49

## Memory: conceptual / programmer's view

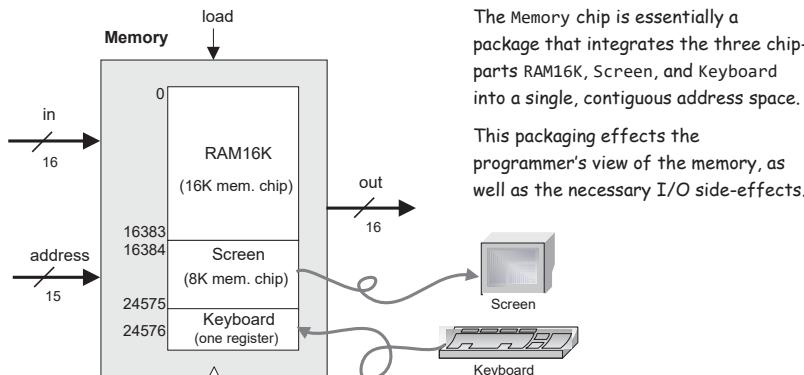

### Using the memory:

- ❑ To record or recall values (e.g. variables, objects, arrays), use the first 16K words of the memory
- ❑ To write to the screen (or read the screen), use the next 8K words of the memory
- ❑ To read which key is currently pressed, use the next word of the memory.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 50

## Memory: physical implementation

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

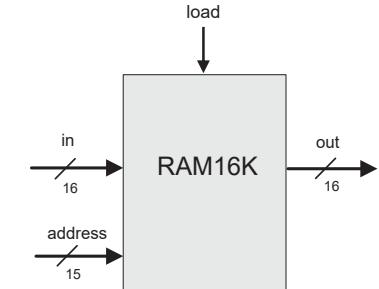

slide 51

## Data memory

### Low-level (hardware) read/write logic:

To read  $\text{RAM}[k]$ : set address to  $k$ , probe out

To write  $\text{RAM}[k]=x$ : set address to  $k$ , set in to  $x$ , set load to 1, run the clock

### High-level (OS) read/write logic:

To read  $\text{RAM}[k]$ : use the OS command  $\text{out} = \text{peek}(k)$

To write  $\text{RAM}[k]=x$ : use the OS command  $\text{poke}(k, x)$

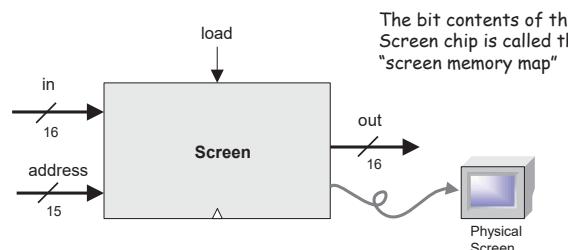

`peek` and `poke` are OS commands whose implementation should effect the same behavior as the low-level commands

More about `peek` and `poke` this later in the course, when we'll write the OS.

Elements of Computing Systems, Nisan & Schocken, MIT Press, [www.nand2tetris.org](http://www.nand2tetris.org), Chapter 5: Computer Architecture

slide 52

## Screen

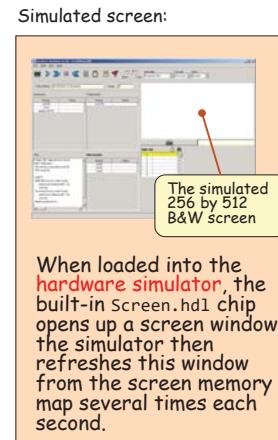

In the Hack platform, the screen is implemented as an 8K 16-bit RAM chip with a side effect of refreshing.

The Screen chip has a basic RAM chip functionality:

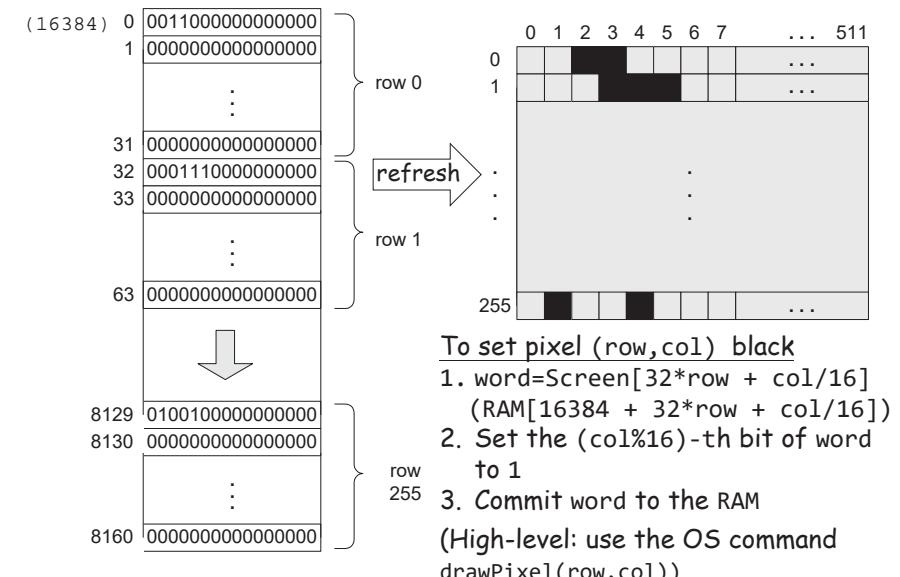

- ❑ read logic:  $out = \text{Screen}[address]$
- ❑ write logic: if load then  $\text{Screen}[address] = in$

### Side effect:

Continuously refreshes a 256 by 512 black-and-white screen device

## Screen memory map

## keyboard

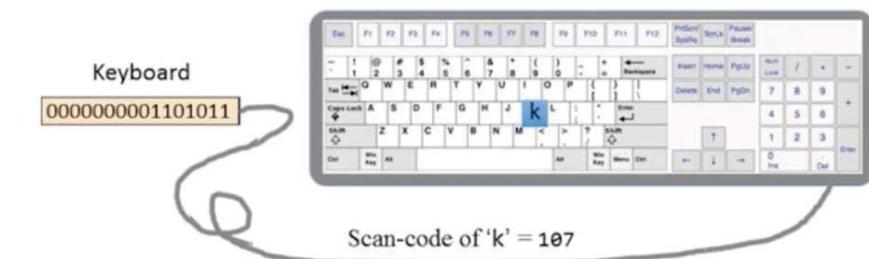

- A 16-bit register is used to keep the key stroke.

When a key is pressed on the keyboard, the key's scan code appears in the keyboard memory map .

## keyboard

- A 16-bit register is used to keep the key stroke.

When a key is pressed on the keyboard, the key's scan code appears in the keyboard memory map .

## Keyboard

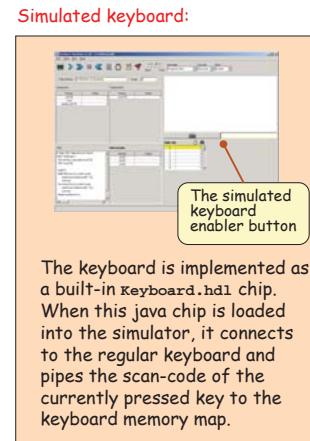

Keyboard chip: a single 16-bit register

Input: scan-code (16-bit value) of the currently pressed key, or 0 if no key is pressed

Output: same

Special keys:

| Key pressed | Keyboard output | Key pressed | Keyboard output |
|-------------|-----------------|-------------|-----------------|
| newline     | 128             | end         | 135             |
| backspace   | 129             | page up     | 136             |
| left arrow  | 130             | page down   | 137             |
| up arrow    | 131             | insert      | 138             |
| right arrow | 132             | delete      | 139             |
| down arrow  | 133             | esc         | 140             |
| home        | 134             | f1-f12      | 141-152         |

How to read the keyboard:

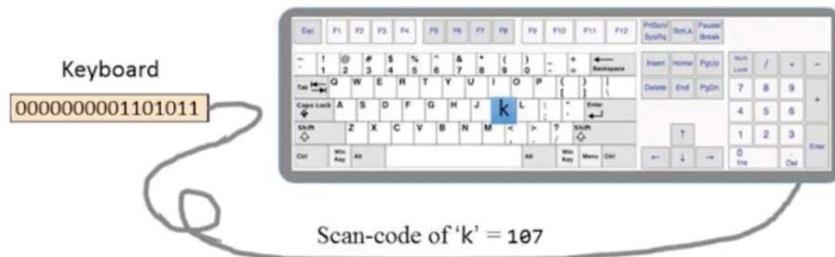

- ❑ Low-level (hardware): probe the contents of the Keyboard chip
- ❑ High-level: use the OS command keyPressed()  
(effects the same operation, discussed later in the course, when we'll write the OS).

## Some scan codes

| key     | code | key | code | key | code | key       | code | key         | code |

| /       | 47   |     |      |     |      |           |      |             |      |

(Subset of Unicode)

## Keyboard memory map

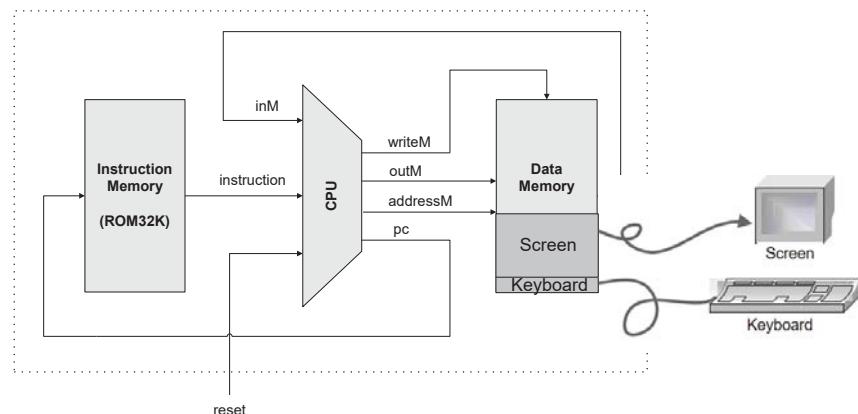

■ To check which key is currently pressed:

- Probe the content of the Keyboard chip
- In the Hack computer, probe the content of RAM[24576]
- If the register contains 0, no key is pressed.

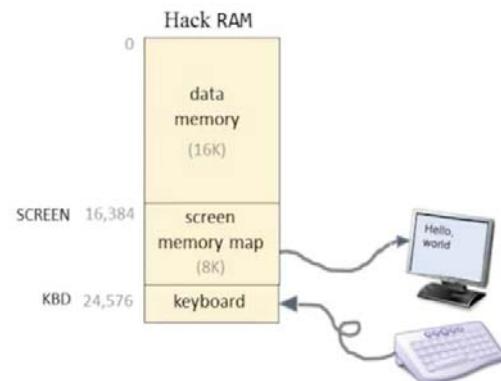

## The Hack computer (put together)

A 16-bit machine consisting of the following elements:

Both memory chips are 16-bit wide and have 15-bit address space.

## Assembly programming with I/O

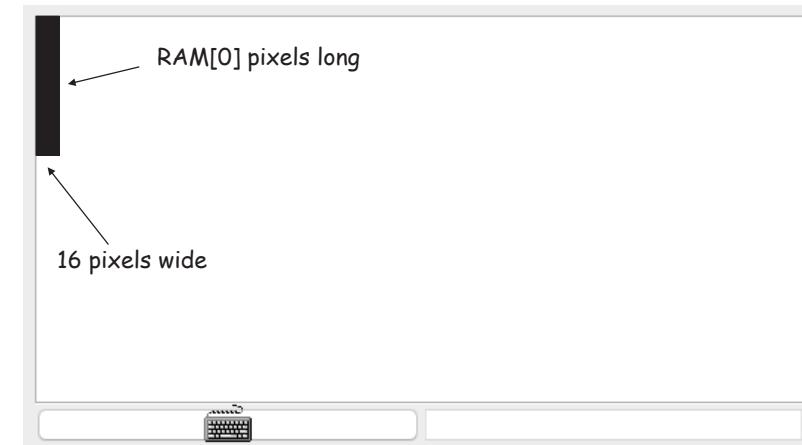

### Hack language convention:

- SCREEN: base address of the screen memory map, 16,384.
- KBD: address of the keyboard memory map, 24,576.

## Example: draw a rectangle

- Draw a filled rectangle at the upper left corner of the screen, 16 pixels wide and RAM[0] pixels long. ([demo](#))

## Example: draw a rectangle (pseudo code)

```
// for (i=0; i<n; i++)
// draw 16 black pixels at the beginning of row i
addr = SCREEN
n = RAM[0]
i = 0

LOOP:
 if (i>=n) goto END
 RAM[addr] = -1 // 1111 1111 1111 1111
 addr = addr+32 // advances to the next row
 i++;
 goto LOOP

END:
 goto END
```

## Example: draw a rectangle (assembly)

```
@SCREEN
D=A
@addr
M=D // addr = SCREEN

@0
D=M
@n
M=D // n = RAM[0]

@i
M=0 // i=0
```

```
addr = SCREEN
n = RAM[0]
i = 0

LOOP:
 if (i>=n) goto END
 RAM[addr] = -1
 addr = addr+32
 i++;
 goto LOOP

END:
 goto END
```

## Example: draw a rectangle (assembly)

```
(LOOP)
 @i
 D=M
 @n
 D=D-M
 @END
 D; JGE

 @addr
 A=M
 M=-1
```

```
addr = SCREEN
n = RAM[0]
i = 0

LOOP:
 if (i>=n) goto END
 RAM[addr] = -1
 addr = addr+32
 i++;
 goto LOOP
END:
 goto END
```

## Example: draw a rectangle (assembly)

```
(LOOP)
 @i
 D=M
 @n
 D=D-M
 @END
 D; JGE

## Example: draw a rectangle (assembly)

```
@32
D=A
@addr
M=D+M // addr = addr+32

@i
M=M+1 // i++

@LOOP
0; JMP // goto LOOP

(END)
@END
0; JMP
```

```
addr = SCREEN
n = RAM[0]
i = 0

LOOP:
 if (i>=n) goto END
 RAM[addr] = -1
 addr = addr+32
 i++;
 goto LOOP
END:
 goto END
```

## Example: draw a rectangle (assembly)

```
@32
D=A
@addr
M=D+M // addr = addr+32

@i
M=M+1 // i++

@LOOP
0; JMP // goto LOOP

(END)
@END
0; JMP
```

```
addr = SCREEN
n = RAM[0]
i = 0

LOOP:
 if (i>=n) goto END
 RAM[addr] = -1
 addr = addr+32
 i++;
 goto LOOP
END:
 goto END
```

## Example: draw a rectangle (assembly)

```

@32
D=A
@addr
M=D+M // addr = addr+32

@i
M=M+1 // i++

@LOOP
0; JMP // goto LOOP

(END)
@END
0; JMP

```

```

addr = SCREEN
n = RAM[0]
i = 0

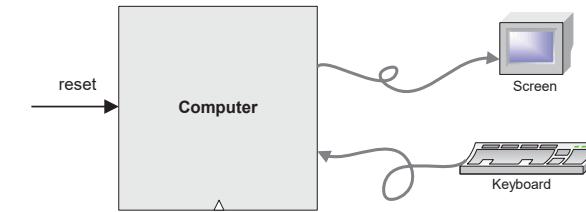

LOOP:
if (i>=n) goto END
RAM[addr] = -1
addr = addr+32
i++;
goto LOOP
END:
goto END

```

## Project #5: Computer-on-a-chip interface

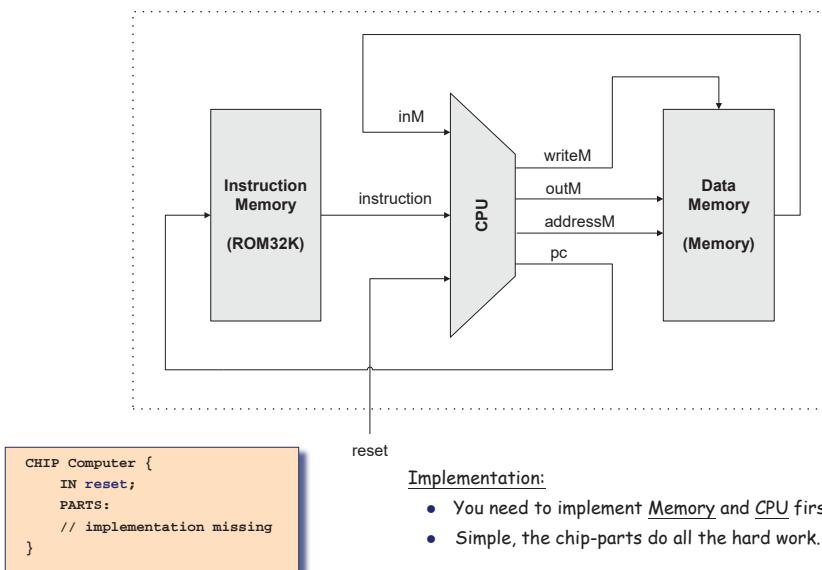

**Chip Name:** Computer // Topmost chip in the Hack platform  
**Input:** reset  
**Function:** When reset is 0, the program stored in the computer's ROM executes. When reset is 1, the execution of the program restarts. Thus, to start a program's execution, reset must be pushed "up" (1) and "down" (0).

From this point onward the user is at the mercy of the software. In particular, depending on the program's code, the screen may show some output and the user may be able to interact with the computer via the keyboard.

slide 71

## Perspective: from here to a “real” computer

- Caching
- More I/O units
- Special-purpose processors (I/O, graphics, communications, ...)
- Multi-core / parallelism
- Efficiency
- Energy consumption considerations
- And more ...
