

Faces and Image-Based Lighting

Digital Visual Effects, Spring 2007

Yung-Yu Chuang

2007/6/12

with slides by Richard Szeliski, Steve Seitz, Alex Efros, Li-Yi Wei and Paul Debevec

Announcements

- TA evaluation
- Final project:
 - Demo on 6/27 (Wednesday) 13:30pm in this room
 - Reports and videos due on 6/28 (Thursday) 11:59pm

Outline

- Image-based lighting
- 3D acquisition for faces
- Statistical methods (with application to face super-resolution)
- 3D Face models from single images
- Image-based faces
- Relighting for faces

Image-based lighting

Rendering

- Rendering is a function of geometry, reflectance, lighting and viewing.
- To synthesize CGI into real scene, we have to match the above four factors.
- Viewing can be obtained from *calibration* or *structure from motion*.
- Geometry can be captured using *3D photography* or made by hands.
- How to capture lighting and reflectance?

Reflectance

- The Bidirectional Reflection Distribution Function
 - Given an incoming ray (θ_i, ϕ_i) and outgoing ray (θ_e, ϕ_e) what proportion of the incoming light is reflected along out

Answer given by the BRDF: $\rho(\theta_i, \phi_i, \theta_e, \phi_e)$

Rendering equation

$$L_o(p, \omega_o) = L_e(p, \omega_o) + \int_{s^2} \rho(p, \omega_o, \omega_i) L_i(p, \omega_i) |\cos \theta_i| d\omega_i$$

Complex illumination

$$L_o(p, \omega_o) = L_e(p, \omega_o) + \int_{s^2} f(p, \omega_o, \omega_i) L_i(p, \omega_i) |\cos \theta_i| d\omega_i$$

$$B(p, \omega_o) = \int_{s^2} f(p, \omega_o, \omega_i) L_d(p, \omega_i) |\cos \theta_i| d\omega_i$$

↑ reflectance ↑ lighting

Point lights

DigiVFX

Classically, rendering is performed assuming point light sources

3D acquisition for faces

Cyberware scanners

face & head scanner

whole body scanner

Making facial expressions from photos

- Similar to Façade, use a generic face model and view-dependent texture mapping
- Procedure
 1. Take multiple photographs of a person
 2. Establish corresponding feature points
 3. Recover 3D points and camera parameters
 4. Deform the generic face model to fit points
 5. Extract textures from photos

Reconstruct a 3D model

model

Mesh deformation

DigiVFX

- Compute displacement of feature points
- Apply scattered data interpolation

generic model

displacement

deformed model

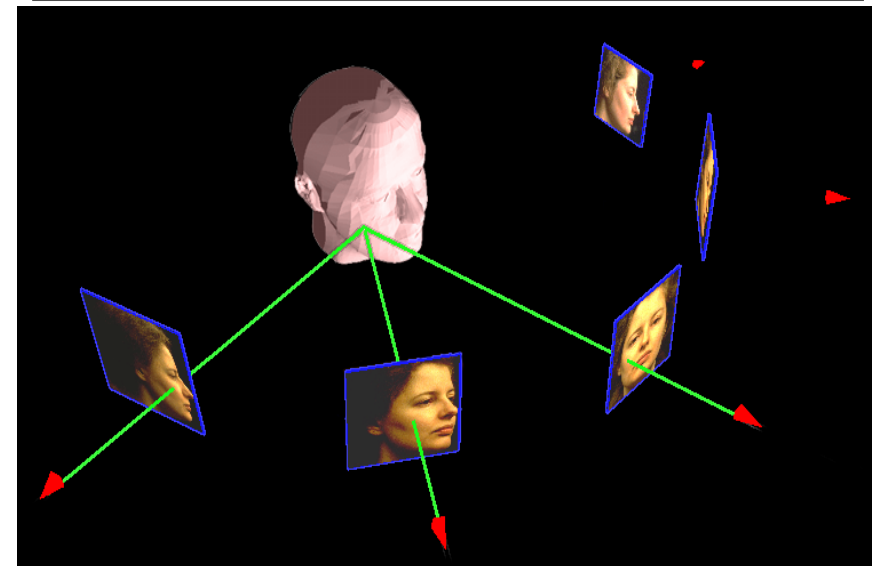

Texture extraction

DigiVFX

- The color at each point is a weighted combination of the colors in the photos
- Texture can be:
 - view-independent
 - view-dependent
- Considerations for weighting
 - occlusion
 - smoothness
 - positional certainty
 - view similarity

Texture extraction

view-dependent

Model reconstruction

DigiVFX

Use images to adapt a generic face model.

Creating new expressions

DigiVFX

- In addition to global blending we can use:
 - Regional blending
 - Painterly interface

Creating new expressions

DigiVFX

New expressions are created with 3D morphing:

Applying a global blend

Creating new expressions

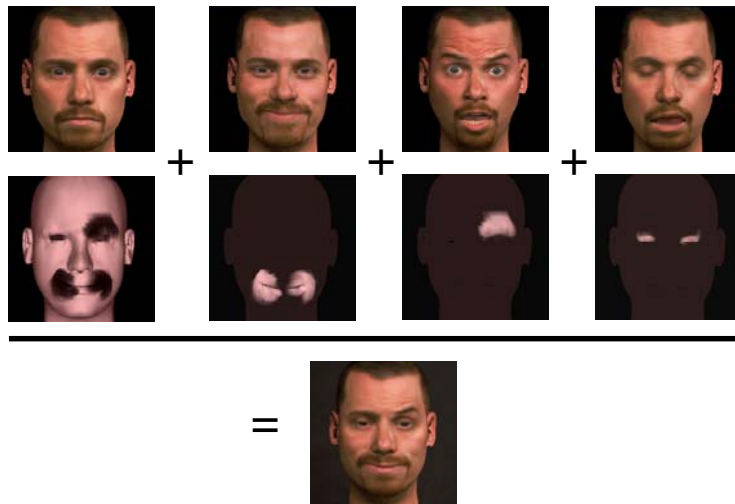

DigiVFX

Applying a region-based blend

Creating new expressions

DigiVFX

Using a painterly interface

Drunken smile

DigiVFX

Animating between expressions

DigiVFX

Morphing over time creates animation:

“neutral”

“joy”

Statistical methods

Statistical methods

DigiVFX

para-
meters $z \longrightarrow \boxed{f(z)+\varepsilon} \longrightarrow y$ observed
signal

$$\begin{aligned} z^* &= \max_z P(z | y) \\ &= \max_z \frac{P(y | z)P(z)}{P(y)} \\ &= \min_z L(y | z) + L(z) \end{aligned}$$

Example:
super-resolution
de-noising
de-blocking
Inpainting

...

Statistical methods

DigiVFX

para-
meters $z \longrightarrow \boxed{f(z)+\varepsilon} \longrightarrow y$ observed
signal

$$z^* = \min_z L(y | z) + L(z)$$

data evidence $\frac{\|y - f(z)\|^2}{\sigma^2}$ a -priori knowledge

Statistical methods

There are approximately 10^{240} possible 10×10 gray-level images. Even human being has not seen them all yet. There must be a strong statistical bias.

Takeo Kanade

Approximately 8×10^{11} blocks per day per person.

Generic priors

“Smooth images are good images.”

$$L(z) = \sum_x \rho(V(x))$$

Gaussian MRF $\rho(d) = d^2$

$$\text{Huber MRF } \rho(d) = \begin{cases} d^2 & |d| \leq T \\ T^2 + 2T(|d| - T) & d > T \end{cases}$$

Generic priors

Example-based priors

“Existing images are good images.”

six 200×200
Images \Rightarrow
2,000,000
pairs

Example-based priors

Example-based priors

Model-based priors

"Face images are good images when working on face images ..."

Parametric model

$$Z = WX + \mu \quad L(X)$$

$$z^* = \min_z L(y | z) + L(z)$$

$$\begin{cases} X^* = \min_x L(y | WX + \mu) + L(X) \\ z^* = WX^* + \mu \end{cases}$$

PCA

- Principal Components Analysis (PCA): approximating a high-dimensional data set with a lower-dimensional subspace

PCA on faces: "eigenfaces"

Model-based priors

Face models from single images

Morphable model of 3D faces

- Start with a catalogue of 200 aligned 3D Cyberware scans

- Build a model of *average* shape and texture, and principal *variations* using PCA

Morphable model

shape exemplars texture exemplars

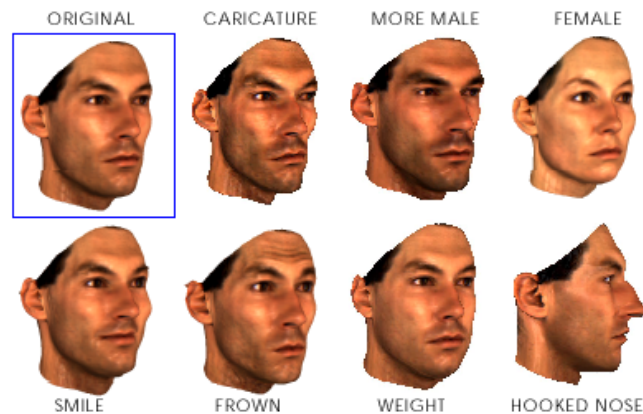

$$S_{model} = \bar{S} + \sum_{i=1}^{m-1} \alpha_i s_i, \quad T_{model} = \bar{T} + \sum_{i=1}^{m-1} \beta_i t_i, \quad (1)$$

$\vec{\alpha}, \vec{\beta} \in \mathbb{R}^{m-1}$. The probability for coefficients $\vec{\alpha}$ is given by

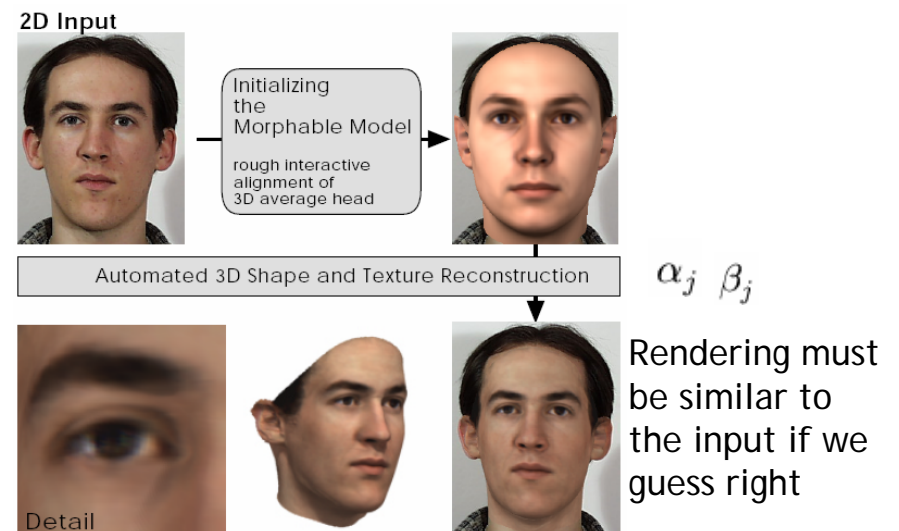

$$p(\vec{\alpha}) \sim \exp\left[-\frac{1}{2} \sum_{i=1}^{m-1} (\alpha_i / \sigma_i)^2\right], \quad (2)$$

Morphable model of 3D faces

- Adding some variations

Reconstruction from single image

Reconstruction from single image

$$E = \frac{1}{\sigma_N^2} E_I + \sum_{j=1}^{m-1} \frac{\alpha_j^2}{\sigma_{S,j}^2} + \sum_{j=1}^{m-1} \frac{\beta_j^2}{\sigma_{T,j}^2} + \sum_j \frac{(\rho_j - \bar{\rho}_j)^2}{\sigma_{\rho,j}^2} \text{ prior}$$

$$E_I = \sum_{x,y} \|\mathbf{I}_{input}(x,y) - \mathbf{I}_{model}(x,y)\|^2$$

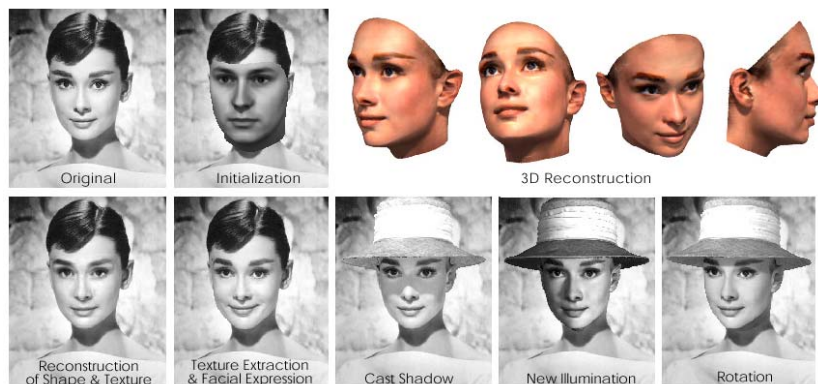

shape and texture priors are learnt from database

ρ is the set of parameters for shading including camera pose, lighting and so on
