High dynamic range imaging

Digital Visual Effects, Spring 2008 Yung-Yu Chuang 2008/2/26

with slides by Fredo Durand, Brian Curless, Steve Seitz, Paul Debevec and Alexei Efros

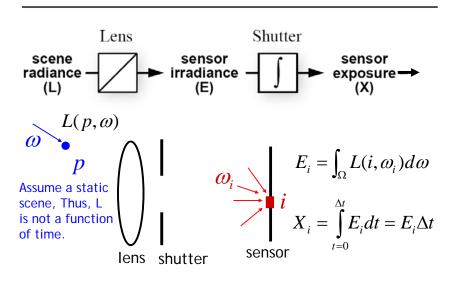

Camera is an imperfect device

 Camera is an imperfect device for measuring the radiance distribution of a scene because it cannot capture the full spectral content and dynamic range.

DigiVFX

• Limitations in sensor design prevent cameras from capturing all information passed by lens.

Camera pipeline

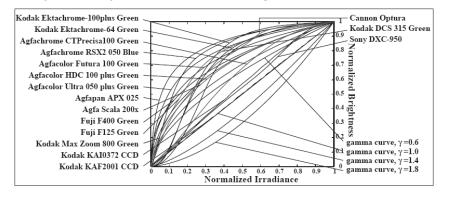

Real-world response functions

In general, the response function is not provided by camera makers who consider it part of their proprietary product differentiation. In addition, they are beyond the standard gamma curves.

DigiVFX

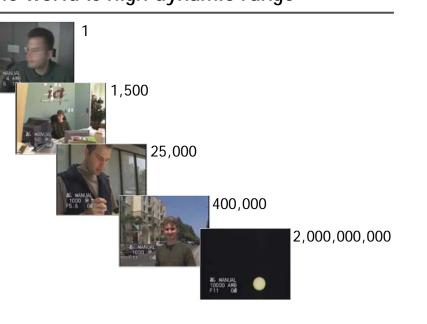

DigiVFX

The world is high dynamic range

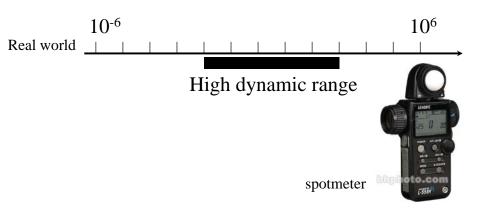

The world is high dynamic range

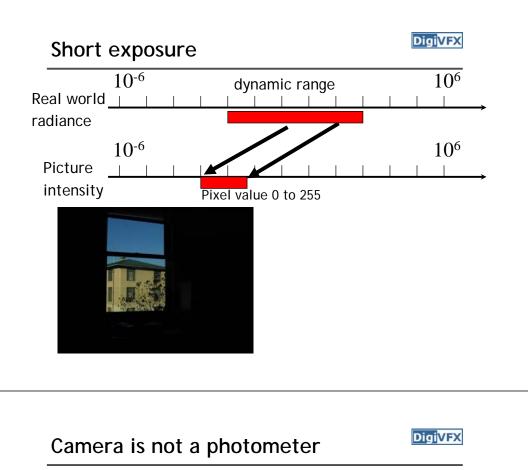

Real world dynamic range

Digi<mark>VFX</mark>

- Eye can adapt from ~ 10^{-6} to 10^{6} cd/m²
- Often 1 : 100,000 in a scene
- Typical 1:50, max 1:500 for pictures

- Limited dynamic range
 ⇒ Perhaps use multiple exposures?
- Unknown, nonlinear response
 - \Rightarrow Not possible to convert pixel values to radiance
- Solution:
 - Recover response curve from multiple exposures, then reconstruct the *radiance map*

Long exposure 10⁻⁶ dynamic range 10⁶ Real world radiance 10⁻⁶ 10⁶ Picture intensity Pixel value 0 to 255 Image: Construction of the second se

Varying exposure

- Ways to change exposure
 - Shutter speed
 - Aperture
 - Neutral density filters

Shutter speed

Digi<mark>VFX</mark>

- Note: shutter times usually obey a power series - each "stop" is a factor of 2
- ¼, 1/8, 1/15, 1/30, 1/60, 1/125, 1/250, 1/500, 1/1000 sec

Usually really is:

¼, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512, 1/1024 sec

HDRI capturing from multiple exposures

- Capture images with multiple exposures
- Image alignment (even if you use tripod, it is suggested to run alignment)
- Response curve recovery
- Ghost/flare removal

Varying shutter speeds

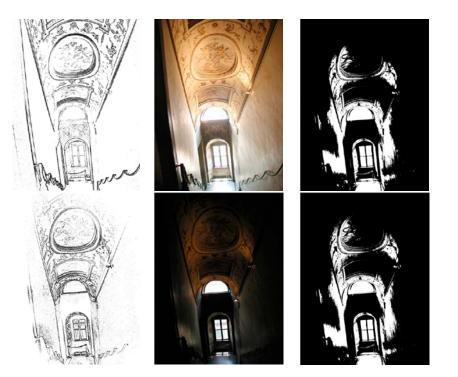

Image alignment

Digi<mark>VF</mark>X

- We will introduce a fast and easy-to-implement method for this task, called Median Threshold Bitmap (MTB) alignment technique.
- Consider only integral translations. It is enough empirically.
- The inputs are N grayscale images. (You can either use the green channel or convert into grayscale by Y=(54R+183G+19B)/256)
- MTB is a binary image formed by thresholding the input image using the median of intensities.

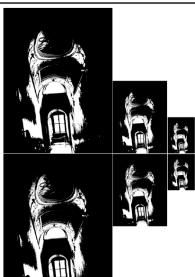

Why is MTB better than gradient?

- Edge-detection filters are dependent on image exposures
- Taking the difference of two edge bitmaps would not give a good indication of where the edges are misaligned.

Search for the optimal offset

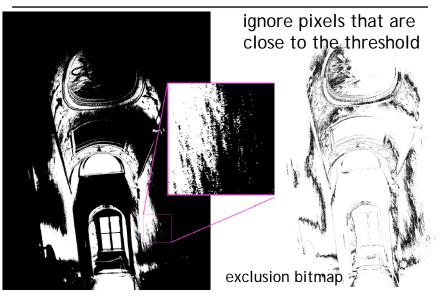

- Try all possible offsets.
- Gradient descent
- Multiscale technique
- log(max_offset) levels
- Try 9 possibilities for the top level
- Scale by 2 when passing down; try its 9 neighbors

DigiVFX

Threshold noise

Efficiency considerations

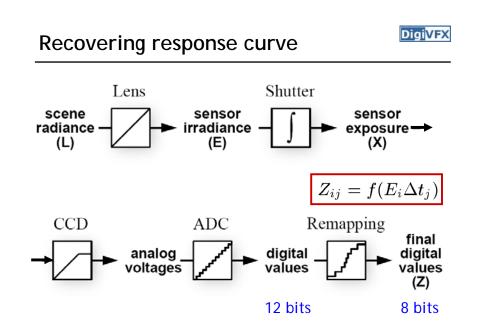

Digi<mark>VFX</mark>

- XOR for taking difference
- AND with exclusion maps
- Bit counting by table lookup

Results

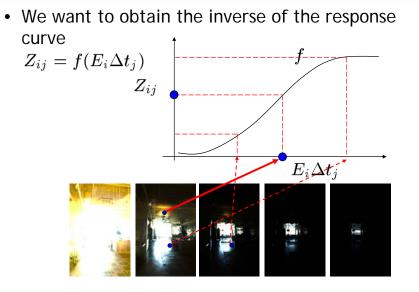

Success rate = 84%. 10% failure due to rotation. 3% for excessive motion and 3% for too much high-frequency content.

Recovering response curve

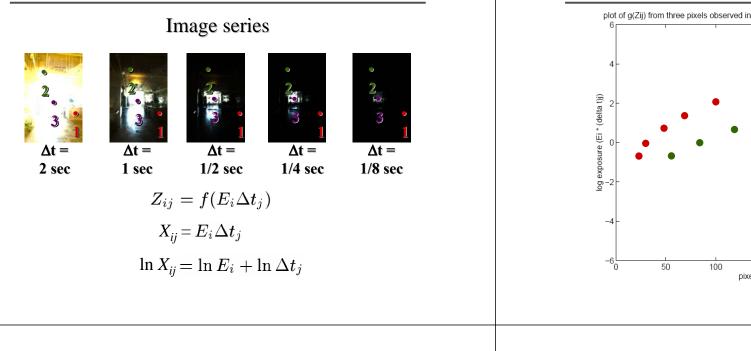

Digi<mark>VFX</mark>

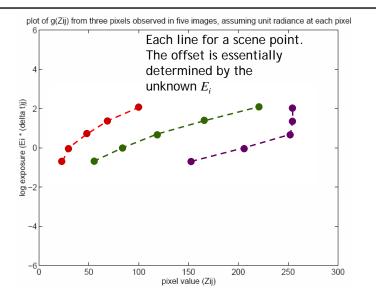

Recovering response curve

DigiVFX

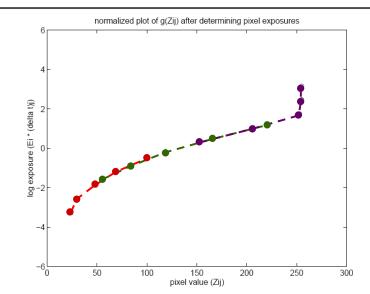

Idea behind the math

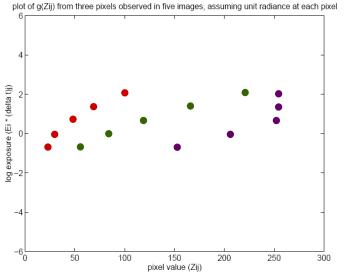

Digi<mark>VFX</mark>

Idea behind the math

Math for recovering response curve

 $Z_{ij} = f(E_i \Delta t_j)$

f is monotonic, it is invertible

$$\ln f^{-1}(Z_{ij}) = \ln E_i + \ln \Delta t_j$$

let us define function $g = \ln f^-$

$$g(Z_{ij}) = \ln E_i + \ln \Delta t_j$$

minimize the following

$$\mathcal{O} = \sum_{i=1}^{N} \sum_{j=1}^{P} \left[g(Z_{ij}) - \ln E_i - \ln \Delta t_j \right]^2 + \lambda \sum_{z=Z_{min}+1}^{Z_{max}-1} g''(z)^2$$
$$g''(z) = g(z-1) - 2g(z) + g(z+1)$$

Recovering response curve

DigiVFX

- We want $N(P-1) > (Z_{max} Z_{min})$ If P=11, N~25 (typically 50 is used)
- We prefer that selected pixels are well distributed and sampled from constant regions. They picked points by hand.
- It is an overdetermined system of linear equations and can be solved using SVD

Recovering response curve

The solution can be only up to a scale, add a constraint

 $g(Z_{mid}) = 0$, where $Z_{mid} = \frac{1}{2}(Z_{min} + Z_{max})$

• Add a hat weighting function

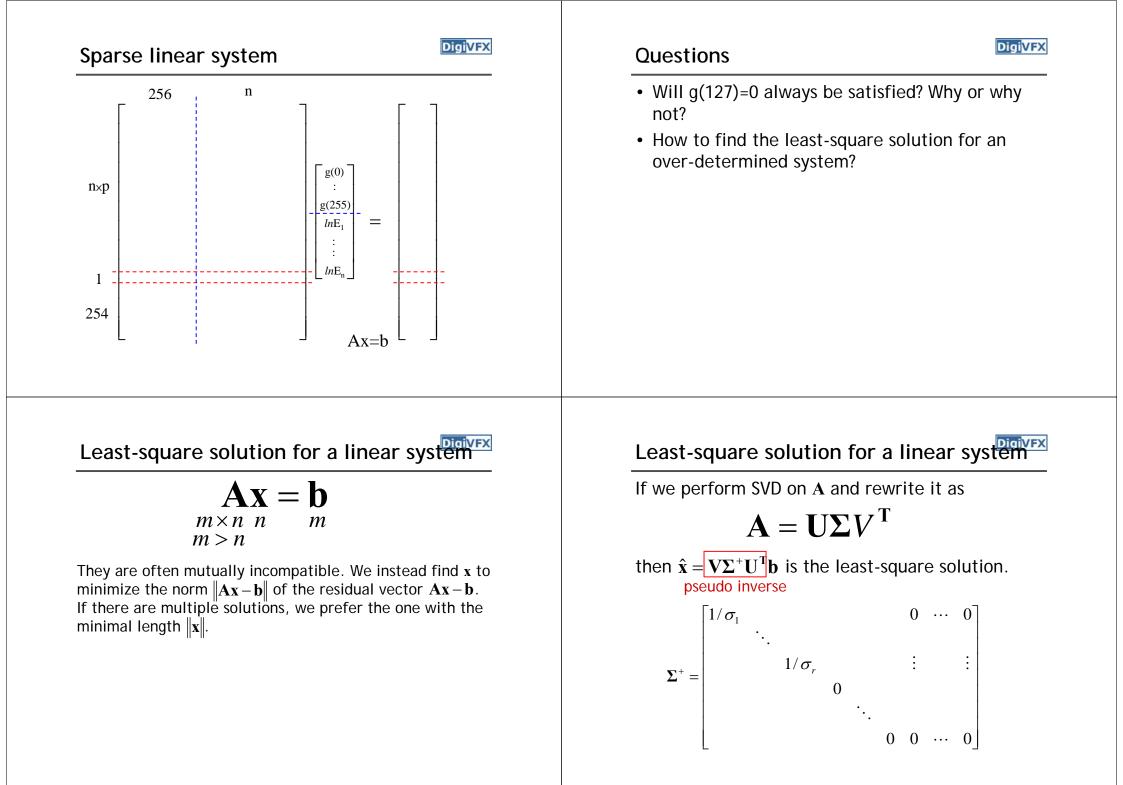

$$w(z) = \begin{cases} z - Z_{min} & \text{for } z \leq \frac{1}{2}(Z_{min} + Z_{max}) \\ Z_{max} - z & \text{for } z > \frac{1}{2}(Z_{min} + Z_{max}) \end{cases}$$
$$\mathcal{O} = \sum_{i=1}^{N} \sum_{j=1}^{P} \{w(Z_{ij}) [g(Z_{ij}) - \ln E_i - \ln \Delta t_j]\}^2 + \lambda \sum_{z=Z_{min}+1}^{Z_{max}-1} [w(z)g''(z)]^2$$

How to optimize?

Digi<mark>VFX</mark>

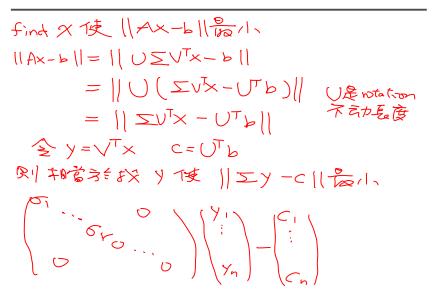

$$\mathcal{O} = \sum_{i=1}^{N} \sum_{j=1}^{P} \{w(Z_{ij}) [g(Z_{ij}) - \ln E_i - \ln \Delta t_j]\}^2 + \lambda \sum_{z=Z_{min}+1}^{Z_{max}-1} [w(z)g''(z)]^2$$
1. Set partial derivatives zero
2.
$$\min \sum_{i=1}^{N} (\mathbf{a}_i \mathbf{x} - \mathbf{b}_i)^2 \rightarrow \text{least-square solution of} \begin{bmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \vdots \\ \mathbf{a}_N \end{bmatrix} \mathbf{x} = \begin{bmatrix} \mathbf{b}_1 \\ \mathbf{b}_2 \\ \vdots \\ \mathbf{b}_N \end{bmatrix}$$

Digi<mark>VFX</mark>

Proof

DigiVFX

Proof

$$\Rightarrow Y_{i} = \frac{C_{i}}{\sigma_{i}} \quad i = 1 \dots r \qquad Y_{i} = 0 \quad i = r + 1 \dots n$$

$$\Rightarrow Y_{i} = \begin{pmatrix} J_{i} & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & & \\ & & & \\ & & & \\$$

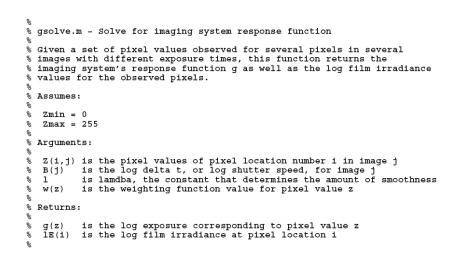

DigiVFX

Matlab

Libraries for SVD

- GSL
- Boost
- LAPACK
- ATLAS

Matlab code

Matlab code

Digi<mark>VFX</mark>

DigiVFX

function [g,lE]=gsolve(Z,B,l,w) n = 256;A = zeros(size(Z,1)*size(Z,2)+n+1,n+size(Z,1));b = zeros(size(A,1),1);%% Include the data-fitting equations k = 1;for i=1:size(Z,1) for j=1:size(Z,2) wij = w(Z(i,j)+1);A(k,Z(i,j)+1) = wij; A(k,n+i) = -wij; b(k,1) = wij * B(i,j);k=k+1; end end A(k, 129) = 1;%% Fix the curve by setting its middle value to 0 k=k+1; for i=1:n-2 %% Include the smoothness equations A(k,i)=l*w(i+1); A(k,i+1)=-2*l*w(i+1); A(k,i+2)=l*w(i+1); k=k+1; end $x = A \setminus b;$ %% Solve the system using SVD g = x(1:n);lE = x(n+1:size(x,1));

Constructing HDR radiance map

 $\ln E_i = q(Z_{ij}) - \ln \Delta t_j$

combine pixels to reduce noise and obtain a more reliable estimation

$$\ln E_{i} = \frac{\sum_{j=1}^{P} w(Z_{ij})(g(Z_{ij}) - \ln \Delta t_{j})}{\sum_{j=1}^{P} w(Z_{ij})}$$

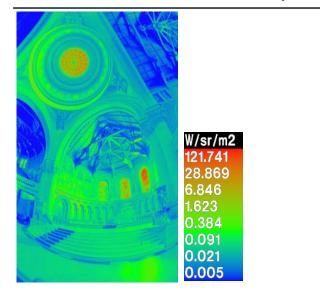

Recovered response function

Reconstructed radiance map

What is this for?

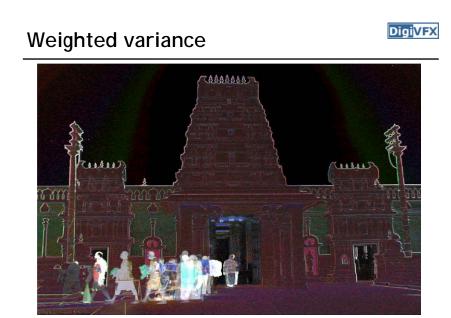

- Human perception
- Vision/graphics applications

Automatic ghost removal

DigiVFX

Radiometric self calibration

DigiVFX

• Assume that any response function can be modeled as a high-order polynomial

$$X = g(Z) = \sum_{m=0}^{M} c_m Z^m$$

 No need to know exposure time in advance. Useful for cheap cameras

Mitsunaga and Nayar

DigiVFX

• To find the coefficients c_m to minimize the following

$$\varepsilon = \sum_{i=1}^{N} \sum_{j=1}^{P} \left[\sum_{m=0}^{M} c_m Z_{ij}^m - R_{j,j+1} \sum_{m=0}^{M} c_m Z_{i,j+1}^m \right]^2$$

A guess for the ratio of

$$\frac{X_{ij}}{X_{i,j+1}} = \frac{E_i \Delta t_j}{E_i \Delta t_{j+1}} = \frac{\Delta t_j}{\Delta t_{j+1}}$$

Mitsunaga and Nayar

- Again, we can only solve up to a scale. Thus, add a constraint f(1)=1. It reduces to M variables.
- How to solve it?

Mitsunaga and Nayar

DigiVFX

• We solve the above iteratively and update the exposure ratio accordingly

$$R_{j,j+1}^{(k)} = \frac{1}{N} \sum_{i=1}^{N} \frac{\sum_{m=0}^{M} c_{m,k}^{(k)} Z_{ij}^{m}}{\sum_{m=0}^{M} c_{m}^{(k)} Z_{i,j+1}^{m}}$$

• How to determine M? Solve up to M=10 and pick up the one with the minimal error. Notice that you prefer to have the same order for all channels. Use the combined error. Robertson et. al.

DigiVE)

$$Z_{ij} = f(E_i \Delta t_j)$$
$$g(Z_{ij}) = f^{-1}(Z_{ij}) = E_i \Delta t$$

Given Z_{ij} and Δt_{ji} the goal is to find both E_i and $g(Z_{ij})$

Maximum likelihood

$$\Pr(E_i, g \mid Z_{ij}, \Delta t_j) \propto \exp\left(-\frac{1}{2} \sum_{ij} w(Z_{ij}) \left(g(Z_{ij}) - E_i \Delta t_j\right)^2\right)$$
$$\hat{g}, \hat{E}_i = \arg\min_{g, E_i} \sum_{ij} w(Z_{ij}) \left(g(Z_{ij}) - E_i \Delta t_j\right)^2$$

Robertson et. al.

Digi<mark>VFX</mark>

$$\hat{g}, \hat{E}_i = \arg\min_{g, E_i} \sum_{ij} w(Z_{ij}) \Big(g(Z_{ij}) - E_i \Delta t_j \Big)^2$$

repeat

assuming $g(Z_{ij})$ is known, optimize for E_i assuming E_i is known, optimize for $g(Z_{ij})$

until converge

Robertson et. al.

DigiVFX

$$\hat{g}, \hat{E}_i = \arg\min_{g, E_i} \sum_{ij} w(Z_{ij}) (g(Z_{ij}) - E_i \Delta t_j)^2$$

repeat

assuming $g(Z_{ij})$ is known, optimize for E_i assuming E_i is known, optimize for $g(Z_{ij})$

until converge

$$g(m) = \frac{1}{|E_m|} \sum_{ij \in E_m} E_i \Delta t_j$$

normalize so that g(128) = 1

Robertson et. al.

$$\hat{g}, \hat{E}_i = \arg\min_{g, E_i} \sum_{ij} w(Z_{ij}) \Big(g(Z_{ij}) - E_i \Delta t_j \Big)^2$$

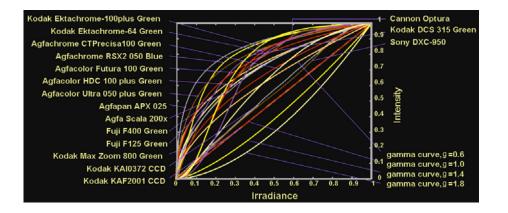

repeat

assuming $g(Z_{ij})$ is known, optimize for E_i assuming E_i is known, optimize for $g(Z_{ij})$ until converge

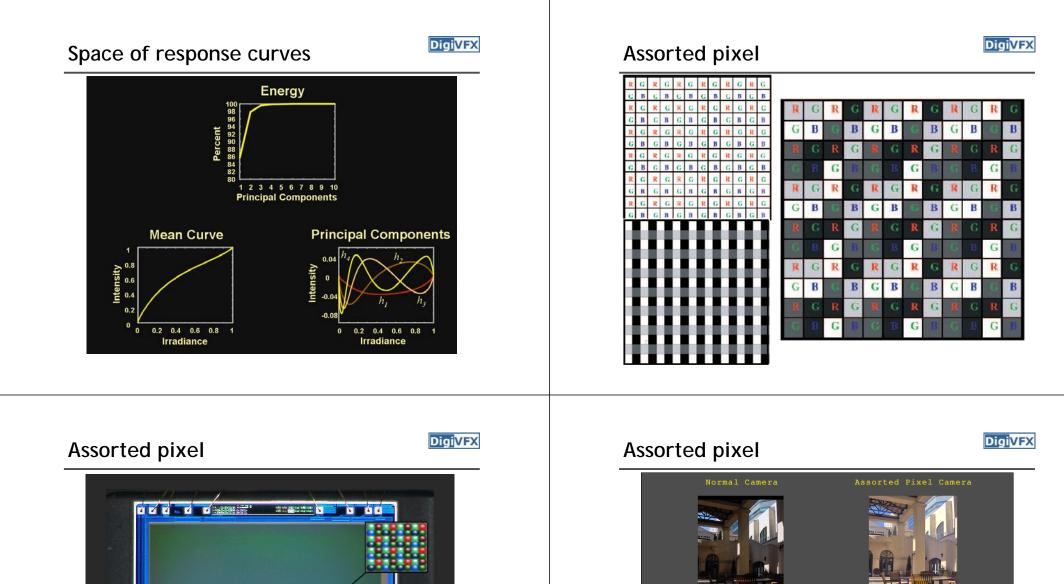

$$E_i = \frac{\sum_j w(Z_{ij})g(Z_{ij})\Delta t_j}{\sum_j w(Z_{ij})\Delta t_j^2}$$

Space of response curves

Assignment #1 HDR image assemble

- Work in teams of two
- Taking pictures
- Assemble HDR images and optionally the response curve.
- Develop your HDR using tone mapping

Taking pictures

- Use a tripod to take multiple photos with different shutter speeds. Try to fix anything else. Smaller images are probably good enough.
- There are two sets of test images available on the web.
- We have tripods and a Canon PowerShot G7 for you to borrow.
- Try not touching the camera during capturing. But, how?

1. Taking pictures

Digi<mark>VFX</mark>

- Use a laptop and a remote capturing program.
 - PSRemote
 - AHDRIA
- PSRemote
 - Manual
 - Not free
 - Supports both jpg and raw
 - Support most Canon's PowerShot cameras
- AHDRIA
 - Automatic
 - Free
 - Only supports jpg
 - Support less models

AHDRIA/AHDRIC/HDRI_Helper

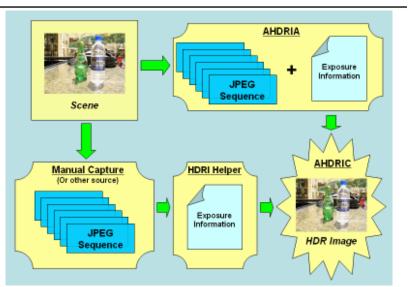

Image registration

- Two programs can be used to correct small drifts.
 - ImageAlignment from RASCAL
 - Photomatix
- Photomatix is recommended.

2. HDR assembling

- Write a program to convert the captured images into a radiance map and optionally to output the response curve.
- We will provide image I/O library, gil, which supports many traditional image formats such as .jpg and .png, and float-point images such as .hdr and .exr.
- Paul Debevec's method. You will need SVD for this method.
- Recover from CCD snapshots. You will need dcraw.c.

3. Tone mapping

Digi<mark>VFX</mark>

DigiVFX

- Apply some tone mapping operation to develop your photograph.
 - Reinhard's algorithm (HDRShop plugin)
 - Photomatix
 - LogView
 - Fast Bilateral (.exr Linux only)
 - PFStmo (Linux only)
 - pfsin a.hdr | pfs_fattal02 | pfsout o.hdr

Bells and Whistles

- Other methods for HDR assembling algorithms
- Implement tone mapping algorithms
- Implement MTB alignment algorithm
- Others

Submission

- You have to turn in your complete source, the executable, a html report, pictures you have taken, HDR image, and an artifact (tone-mapped image).
- Report page contains:

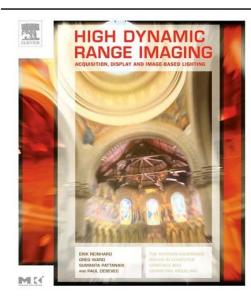

description of the project, what do you learn, algorithm, implementation details, results, bells and whistles...

- The class will have vote on artifacts.
- Submission mechanism will be announced later.

Reference software

- Photomatix
- AHDRIA/AHDRIC
- HDRShop
- RASCAL
