## Outline

- Epipolar geometry and fundamental matrix
- Structure from motion
- Factorization method
- Bundle adjustment
- Applications

Epipolar geometry \& fundamental matrix

## The epipolar geometry

epipolar geometry demo

$C, C^{\prime}, x, X^{\prime}$ and $X$ are coplanar

## The epipolar geometry

What if only $C, C^{\prime}, x$ are known?

## The epipolar geometry

All points on $\pi$ project on I and I'

## The epipolar geometry

Family of planes $\pi$ and lines $l$ and $l^{\prime}$ intersect at $e$ and $e$ '

## The epipolar geometry

epipolar pole
epipolar geometry demo
= intersection of baseline with image plane
= projection of projection center in other image

epipolar plane = plane containing baseline epipolar line $=$ intersection of epipolar plane with image

## The fundamental matrix F

Two reference frames are related via the extrinsic parameters

$$
\mathrm{p}^{\prime}=\mathrm{R}(\mathrm{p}-\mathrm{T})
$$

The equation of the epipolar plane through $X$ is

$$
(\mathbf{p}-\mathbf{T})^{\mathrm{T}}(\mathbf{T} \times \mathbf{p})=0 \Rightarrow\left(\mathbf{R}^{\mathrm{T}} \mathbf{p}^{\prime}\right)^{\mathrm{T}}(\mathbf{T} \times \mathbf{p})=0
$$

## The fundamental matrix $F$

$$
\begin{gathered}
\left(\mathbf{R}^{\mathrm{T}} \mathbf{p}^{\prime}\right)^{\mathrm{T}}(\mathbf{T} \times \mathbf{p})=0 \\
\mathbf{T} \times \mathbf{p}=\mathbf{S p} \\
\mathbf{S}=\left[\begin{array}{ccc}
0 & -T_{z} & T_{y} \\
T_{z} & 0 & -T_{x} \\
-T_{y} & T_{x} & 0
\end{array}\right] \\
\left(\mathbf{R}^{\mathrm{T}} \mathbf{p}^{\prime}\right)^{\mathrm{T}}(\mathbf{S p})=0 \\
\left(\mathbf{p}^{\prime \mathrm{T}} \mathbf{R}\right)(\mathbf{S} \mathbf{p})=0 \\
\mathbf{p}^{\prime \mathrm{T}} \mathbf{E} \mathbf{p}=0 \quad \text { essential matrix }
\end{gathered}
$$

## The fundamental matrix $F$

$$
\mathbf{p}^{\mathrm{T}} \mathbf{E p}=0
$$

Let $M$ and $M$ ' be the intrinsic matrices, then

$$
\mathbf{p}=\mathbf{M}^{-1} \mathbf{x} \quad \mathbf{p}^{\prime}=\mathbf{M}^{-1} \mathbf{x}^{\prime}
$$

$\left(\mathbf{M}^{\boldsymbol{r}^{-1}} \mathbf{x}^{\prime}\right)^{\mathrm{T}} \mathbf{E}\left(\mathbf{M}^{-1} \mathbf{x}\right)=0$
$\mathbf{x}^{\mathrm{T}} \mathbf{M}^{\mathbf{1}^{-\mathrm{T}} \mathbf{E} \mathbf{M}^{-1} \mathbf{x}=0}$
$\mathbf{x}^{\mathrm{T}} \mathbf{x}=0 \quad$ fundamental matrix

## The fundamental matrix $F$

- The fundamental matrix is the algebraic representation of epipolar geometry
- The fundamental matrix satisfies the condition that for any pair of corresponding points $\mathrm{X} \leftrightarrow \mathrm{x}$ ’ in the two images

$$
x^{\prime T} \mathrm{FX}=0 \quad\left(\mathrm{x}^{\prime \mathrm{T}} \mathrm{l}^{\prime}=0\right)
$$

## The fundamental matrix F

$F$ is the unique $3 x 3$ rank 2 matrix that satisfies $x^{\top}{ }^{\top} F x=0$ for all $x \leftrightarrow x^{\prime}$

1. Transpose: if $F$ is fundamental matrix for ( $P, P^{\prime}$ ), then $F^{\top}$ is fundamental matrix for ( $P^{\prime}, P$ )
2. Epipolar lines: $l^{\prime}=F x \& l=F^{\top} x^{\prime}$
3. Epipoles: on all epipolar lines, thus $e^{\top} F x=0, \forall x$ $\Rightarrow e^{\top} \mathrm{T}=0$, similarly $\mathrm{Fe}=0$
4. $F$ has 7 d.o.f., i.e. $3 \times 3-1$ (homogeneous) -1 (rank2)
5. $\mathbf{F}$ is a correlation, projective mapping from a point $x$ to a line l'=Fx (not a proper correlation, i.e. not invertible)

## The fundamental matrix $F$

- It can be used for
- Simplifies matching
- Allows to detect wrong matches

## Estimation of F - 8-point algorithm

- The fundamental matrix F is defined by

$$
\mathbf{x}^{\prime \mathrm{T}} \mathbf{F} \mathbf{x}=0
$$

for any pair of matches $\mathbf{x}$ and $\mathbf{x}^{\prime}$ in two images.

- Let $\mathbf{x}=(u, v, 1)^{\top}$ and $\mathbf{x}^{\prime}=\left(u^{\prime}, v^{\prime}, 1\right)^{\top}, \quad \mathbf{F}=\left[\begin{array}{lll}f_{11} & f_{12} & f_{13} \\ f_{21} & f_{22} & f_{23} \\ f_{31} & f_{32} & f_{33}\end{array}\right]$ each match gives a linear equation

$$
u u^{\prime} f_{11}+v u^{\prime} f_{12}+u^{\prime} f_{13}+u v^{\prime} f_{21}+v v^{\prime} f_{22}+v^{\prime} f_{23}+u f_{31}+v f_{32}+f_{33}=0
$$

## 8-point algorithm

- In reality, instead of solving $\mathbf{A f}=0$, we seek $\mathbf{f}$ to minimize $\|\mathbf{A f}\|$ subj. $\|\mathbf{f}\|=1$. Find the vector corresponding to the least singular value.

## 8-point algorithm

- To enforce that $F$ is of rank 2, $F$ is replaced by $F^{\prime}$ that minimizes $\left\|\mathbf{F}-\mathbf{F}^{\prime}\right\|$ subject to $\operatorname{det} \mathbf{F}^{\prime}=0$.
- It is achieved by SVD. Let $\mathbf{F}=\mathbf{U} \Sigma \mathbf{V}^{\mathrm{T}}$, where

$$
\Sigma=\left[\begin{array}{ccc}
\sigma_{1} & 0 & 0 \\
0 & \sigma_{2} & 0 \\
0 & 0 & \sigma_{3}
\end{array}\right] \text {, let } \Sigma^{\prime}=\left[\begin{array}{ccc}
\sigma_{1} & 0 & 0 \\
0 & \sigma_{2} & 0 \\
0 & 0 & 0
\end{array}\right]
$$

then $\mathbf{F}^{\prime}=\mathbf{U} \Sigma^{\prime} \mathbf{V}^{\mathrm{T}}$ is the solution.

## 8-point algorithm

\% Build the constraint matrix
$[\mathrm{U}, \mathrm{D}, \mathrm{V}]=\operatorname{svd}(\mathrm{A}) ;$
\% Extract fundamental matrix from the column of V
\% corresponding to the smallest singular value.
F = reshape(V(:,9), 3,3)';
\% Enforce rank2 constraint

$$
[\mathrm{U}, \mathrm{D}, \mathrm{~V}]=\operatorname{svd}(\mathrm{F}) ;
$$

$$
F=U^{*} \operatorname{diag}([D(1,1) D(2,2) 0])^{*} V^{\prime} ;
$$

$$
\begin{aligned}
& \text { A = [x2(1,:)،..*x1(1,:)' x2(1,::)'.*x1(2,:)' x2(1,::)'... } \\
& \text { x2(2,:)'..*x1(1,:)' x2(2,::'..*x1(2,:)' x2(2,:)' ... } \\
& \text { x1(1,:)' x1(2,:) ones(npts,1)]; }
\end{aligned}
$$

## 8-point algorithm

- Pros: it is linear, easy to implement and fast
- Cons: susceptible to noise

## Problem with 8-point algorithm

$\rightarrow$ least-squares yields poor results

## Normalized 8-point algorithm

1. Transform input by $\hat{\mathbf{x}}_{\mathrm{i}}=\mathbf{T} \mathbf{x}_{\mathrm{i}}, \hat{\mathbf{x}}_{\mathrm{i}}^{\prime}=\mathbf{T} \mathbf{x}_{\mathrm{i}}^{\prime}$
2. Call 8-point on $\hat{\mathbf{x}}_{\mathrm{i}}, \hat{\mathbf{x}}_{\mathbf{i}}^{\prime}$ to obtain $\hat{\mathbf{F}}$
3. $\mathbf{F}=\mathbf{T}^{\mathrm{T}} \hat{\mathbf{F}} \mathbf{T}$

## Normalized 8-point algorithm

## normalized least squares yields good results

Transform image to $\sim[-1,1] \times[-1,1]$

## Normalized 8-point algorithm

[x1, T1] = normalise2dpts(x1);
[x2, T2] = normalise2dpts(x2);
$\begin{aligned} A= & {\left[x 2(1,:)^{\prime} .^{*} \times 1(1,:)^{\prime}\right.} & x 2(1,::)^{\prime} .{ }^{*} \times 1(2,:)^{\prime} & \times 2(1,:)^{\prime} \ldots \\ & \times 2(2,:)^{\prime} .{ }^{*} \times 1(1,:)^{\prime} & \times 2(2,:)^{\prime} .{ }^{*} \times 1(2,:)^{\prime} & \times 2(2,:)^{\prime} \ldots \\ & \times 1(1,:)^{\prime} & x 1(2,::)^{\prime} & \text { ones(npts, } 1)] ;\end{aligned}$
[U,D,V] = svd(A);
F = reshape(V(:,9),3,3)';
[U,D,V] = svd(F);
$F=U^{*} \operatorname{diag}([D(1,1) D(2,2) 0])^{*} V^{\prime} ;$
\% Denormalise
F = T2'*F'T1;

## Normalization

function [newpts, T] = normalise2dpts(pts)

```
c = mean(pts(1:2,:)')'; % Centroid
newp(1,:) = pts(1,:)-c(1); % Shift origin to centroid.
newp(2,:) = pts(2,:)-c(2);
```

meandist $=$ mean(sqrt(newp(1,:).^2 + newp(2,:).^2));
scale = sqrt(2)/meandist;

```
T = [scale 0 -scale*c(1)
    0 scale -scale*c(2)
    0 0 1 ];
```

newpts $=\mathrm{T}^{*}$ pts;

## RANSAC

## repeat

> select minimal sample (8 matches)
compute solution(s) for $F$
determine inliers
until $\Gamma$ (\#inliers,\#samples)>95\% or too many times
compute F based on all inliers

## Results (ground truth)

## Results (8-point algorithm)

## Results (normalized 8-point algorithm)

## Structure from motion

## Structure from motion

structure for motion: automatic recovery of camera motion and scene structure from two or more images. It is a self calibration technique and called automatic camera tracking or matchmoving.

## Applications

- For computer vision, multiple-view shape reconstruction, novel view synthesis and autonomous vehicle navigation.
- For film production, seamless insertion of CGI into live-action backgrounds

## Matchmove

example \#1
example \#2
example \#3
example \#4

| :---: |
| fitting |

## SFM pipeline

## Structure from motion

- Step 1: Track Features
- Detect good features, Shi \& Tomasi, SIFT
- Find correspondences between frames
- Lucas \& Kanade-style motion estimation
- window-based correlation
- SIFT matching

## KLT tracking

http://www.ces.clemson.edu/~stb/klt/

## Structure from Motion

- Step 2: Estimate Motion and Structure
- Simplified projection model, e.g., [Tomasi 92]
- 2 or 3 views at a time [Hartley 00]

## Structure from Motion

- Step 3: Refine estimates
- "Bundle adjustment" in photogrammetry
- Other iterative methods

## Structure from Motion

- Step 4: Recover surfaces (image-based triangulation, silhouettes, stereo...)

Factorization methods

## Problem statement

## Notations

- n 3 D points are seen in m views
- $\mathbf{q}=(u, v, 1)$ : 2D image point
- $\mathbf{p}=(x, y, z, 1)$ : 3D scene point
- П: projection matrix
- $\pi$ : projection function
- $q_{i j}$ is the projection of the $i$-th point on image $j$
- $\lambda_{\mathrm{ij}}$ projective depth of $\mathrm{q}_{\mathrm{ij}}$

$$
\begin{array}{ll}
\mathbf{q}_{i j}=\pi\left(\Pi_{j} \mathbf{p}_{i}\right) \quad & \pi(x, y, z)=(x / z, y / z) \\
& \lambda_{i j}=z
\end{array}
$$

## Structure from motion

- Estimate $\Pi_{j}$ and $\mathbf{p}_{i}$ to minimize

$$
\begin{gathered}
\varepsilon\left(\boldsymbol{\Pi}_{1}, \cdots, \boldsymbol{\Pi}_{m}, \mathbf{p}_{1}, \cdots, \mathbf{p}_{n}\right)=\sum_{j=1}^{m} \sum_{i=1}^{n} w_{i j} \log P\left(\pi\left(\boldsymbol{\Pi}_{j} \mathbf{p}_{i}\right) ; \mathbf{q}_{i j}\right) \\
w_{i j}= \begin{cases}1 & \text { if } p_{i} \text { is visible in view } \mathrm{j} \\
0 & \text { otherwise }\end{cases}
\end{gathered}
$$

- Assume isotropic Gaussian noise, it is reduced to

$$
\varepsilon\left(\boldsymbol{\Pi}_{1}, \cdots, \boldsymbol{\Pi}_{m}, \mathbf{p}_{1}, \cdots, \mathbf{p}_{n}\right)=\sum_{j=1}^{m} \sum_{i=1}^{n} w_{i j}\left\|\pi\left(\boldsymbol{\Pi}_{j} \mathbf{p}_{i}\right)-\mathbf{q}_{i j}\right\|^{2}
$$

- Start from a simpler projection model

## SFM under orthographic projection

- Choose scene origin to be centroid of 3D points
- Choose image origins to be centroid of 2D points
- Allows us to drop the camera translation:

$$
\mathbf{q}=\Pi \mathbf{p}
$$

## factorization (Tomasi \& Kanade)

projection of $\mathbf{n}$ features in one image:

$$
\left[\begin{array}{llll}
\mathbf{q}_{1} & \mathbf{q}_{2} & \cdots & \mathbf{q}_{\mathrm{n}}
\end{array}\right]=\prod_{2 \times \mathrm{n}}\left[\begin{array}{llll}
\mathbf{p}_{1} & \mathbf{p}_{2} & \cdots & \mathbf{p}_{\mathrm{n}}
\end{array}\right]
$$

projection of $\mathbf{n}$ features in $m$ images

$$
\begin{aligned}
& {\left[\begin{array}{cccc}
\mathbf{q}_{11} & \mathbf{q}_{12} & \cdots & \mathbf{q}_{1 n} \\
\mathbf{q}_{21} & \mathbf{q}_{22} & \cdots & \mathbf{q}_{2 n} \\
\vdots & \vdots & \ddots & \vdots \\
\mathbf{q}_{m 1} & \mathbf{q}_{m 2} & \cdots & \mathbf{q}_{m n}
\end{array}\right] } {\left[\begin{array}{c}
\boldsymbol{\Pi}_{1} \\
\boldsymbol{\Pi}_{2} \\
\vdots \\
\boldsymbol{\Pi}_{m} \times \mathrm{n}
\end{array}\right] } \\
&\left.\begin{array}{cccc}
\mathbf{p}_{1} & \mathbf{p}_{2} & \cdots & \mathbf{p}_{n}
\end{array}\right] \\
& 3 \times \mathrm{n} \\
&
\end{aligned}
$$

$\mathbf{W}_{\text {measurement }} \quad \mathbf{M}_{\text {motion }} \quad \mathrm{S}_{\text {shape }}$
Key Observation: $\operatorname{rank}(\mathbf{W})<=3$

## Factorization

- Factorization Technique
- W is at most rank 3 (assuming no noise)
- We can use singular value decomposition to factor $\mathbf{W}$ :

$$
\underset{2 \mathrm{~m} \times \mathrm{n}}{\mathbf{W}}=\underset{2 \mathrm{~m} \times 3}{\mathbf{M}^{\prime}} \mathbf{S}_{3 \times \mathrm{n}}
$$

- S' differs from Sby a linear transformation $\mathbf{A}:$

$$
\mathbf{W}=\mathbf{M}^{\prime} \mathbf{S}^{\prime}=\left(\mathbf{M A}^{-\mathbf{1}}\right)(\mathbf{A S})
$$

- Solve for A by enforcing metric constraints on M

## Metric constraints

- Orthographic Camera
- Rows of $\Pi$ are orthonormal: $\Pi \Pi^{T}=\left[\begin{array}{ll}0 & 1\end{array}\right]$
- Enforcing "Metric" Constraints
- Compute A such that rows of Mhave these properties

$$
\mathbf{M}^{\prime} \mathbf{A}=\mathbf{M}
$$

Trick (not in original Tomasi/Kanade paper, but in followup work)

- Constraints are linear in $\mathbf{A A}^{\top}$ :
$\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right]=\Pi^{T}=\Pi^{\prime} \mathbf{A}\left(\mathbf{A} \Pi^{\prime}\right)^{T}=\Pi^{\prime} \mathbf{G} \Pi^{\prime T} \quad$ where $\mathbf{G}=\mathbf{A A}^{T}$
- Solve for $\mathbf{G}$ first by writing equations for every $\Pi_{i}$ in $\mathbf{M}$
- Then $\mathbf{G}=\mathbf{A A}^{\top}$ by SVD (since $\mathbf{U}=\mathbf{V}$ )

## Factorization with noisy data

$$
\underset{2 \mathrm{~m} \times \mathrm{n}}{\mathbf{W}}=\underset{2 \mathrm{~m} \times 3}{\mathbf{M}} \underset{3 \times \mathrm{n}}{\mathbf{S}}+\underset{2 \mathrm{~m} \times \mathrm{n}}{\mathbf{E}}
$$

- SVD gives this solution
- Provides optimal rank 3 approximation $\mathbf{W}$ of $\mathbf{w}$

$$
\underset{2 \mathrm{~m} \times \mathrm{n}}{\boldsymbol{W}}=\underset{2 \mathrm{~m} \times \mathrm{n}}{\mathbf{W}^{\prime}}+\underset{2 \mathrm{~m} \times \mathrm{n}}{\mathbf{E}}
$$

- Approach
- Estimate $\mathbf{W}$, then use noise-free factorization of $\mathbf{W}$ as before
- Result minimizes the SSD between positions of image features and projection of the reconstruction

## Results

DigjVFX

## Extensions to factorization methods

- Projective projection
- With missing data
- Projective projection with missing data

Bundle adjustment

## Levenberg-Marquardt method

- LM can be thought of as a combination of steepest descent and the Newton method. When the current solution is far from the correct one, the algorithm behaves like a steepest descent method: slow, but guaranteed to converge. When the current solution is close to the correct solution, it becomes a Newton's method.

## Nonlinear least square

Given a set of measurements $\mathbf{x}$, try to find the best parameter vector $\mathbf{p}$ so that the squared distance $\varepsilon^{T} \varepsilon$ is minimal. Here, $\varepsilon=\mathbf{x}-\hat{\mathbf{x}}$, with $\hat{\mathbf{x}}=f(\mathbf{p})$.

## Levenberg-Marquardt method

For a small $\left\|\delta_{\mathbf{p}}\right\|, f\left(\mathbf{p}+\delta_{\mathbf{p}}\right) \approx f(\mathbf{p})+\mathbf{J} \delta_{\mathbf{p}}$

$$
\mathbf{J} \text { is the Jacobian matrix } \frac{\partial f(\mathbf{p})}{\partial \mathbf{p}}
$$

it is required to find the $\delta_{\mathbf{p}}$ that minimizes the quantity

$$
\begin{gathered}
\left\|\mathbf{x}-f\left(\mathbf{p}+\delta_{\mathbf{p}}\right)\right\| \approx\left\|\mathbf{x}-f(\mathbf{p})-\mathbf{J} \delta_{\mathbf{p}}\right\|=\left\|\epsilon-\mathbf{J} \delta_{\mathbf{p}}\right\| \\
\mathbf{J}^{T} \mathbf{J} \delta_{\mathbf{p}}=\mathbf{J}^{T} \epsilon \\
\mathbf{N} \delta_{\mathbf{p}}=\mathbf{J}^{T} \epsilon \\
\mathbf{\mathbf { N } _ { i i }}=\underset{\uparrow}{\mu}+\left[\mathbf{J}^{T} \mathbf{J}\right]_{i i} \\
\text { damping term }
\end{gathered}
$$

## Levenberg-Marquardt method

- $\mu=0 \rightarrow$ Newton's method
- $\mu \rightarrow \infty \rightarrow$ steepest descent method
- Strategy for choosing $\mu$
- Start with some small $\mu$
- If error is not reduced, keep trying larger $\mu$ until it does
- If error is reduced, accept it and reduce $\mu$ for the next iteration

## Bundle adj ustment

- Bundle adjustment (BA) is a technique for simultaneously refining the 3D structure and camera parameters
- It is capable of obtaining an optimal reconstruction under certain assumptions on image error models. For zero-mean Gaussian image errors, BA is the maximum likelihood estimator.

## Bundle adjustment

- $n$ 3D points are seen in $m$ views
- $x_{i j}$ is the projection of the $i$-th point on image $j$
- $a_{j}$ is the parameters for the $j$-th camera
- $b_{i}$ is the parameters for the $i$-th point
- BA attempts to minimize the projection error

$$
\min _{\mathbf{a}_{j}, \mathbf{b}_{i}} \sum_{i=1}^{n} \sum_{j=1}^{m} \underset{\prod_{\text {predicted projection }}^{d}}{d\left(\mathbf{Q}\left(\mathbf{a}_{j}, \mathbf{b}_{i}\right), \mathbf{x}_{i j}\right)^{2}}
$$

Euclidean distance

## Bundle adjustment

## Bundle adjustment

3 views and 4 points $\mathbf{P}=\left(\mathbf{a}_{1}{ }^{T}, \mathbf{a}_{2}{ }^{T}, \mathbf{a}_{3}{ }^{T}, \mathbf{b}_{1}{ }^{T}, \mathbf{b}_{2}{ }^{T}, \mathbf{b}_{3}{ }^{T}, \mathbf{b}_{4}{ }^{T}\right)^{T}$ $\mathbf{X}=\left(\mathbf{x}_{11}{ }^{T}, \mathbf{x}_{12}{ }^{T}, \mathbf{x}_{13}{ }^{T}, \mathbf{x}_{21}{ }^{T}, \mathbf{x}_{22}{ }^{T}, \mathbf{x}_{23}{ }^{T}, \mathbf{x}_{31}^{T}, \mathbf{x}_{32}^{T}, \mathbf{x}_{33}^{T}, \mathbf{x}_{41}{ }^{T}, \mathbf{x}_{42}{ }^{T}, \mathbf{x}_{43}{ }^{T}\right)^{T}$

$$

\mathbf{U}^{*}-\mathbf{W} \mathbf{V}^{*-1} \mathbf{W}^{T} & \mathbf{0} \\
\mathbf{W}^{T} & \mathbf{V}^{*}
\end{array}\right)\binom{\delta_{\mathbf{a}}}{\delta_{\mathbf{b}}}=\binom{\epsilon_{\mathbf{a}}-\mathbf{W} \mathbf{V}^{*-1} \epsilon_{\mathbf{b}}}{\epsilon_{\mathbf{b}}}
$$

$$
\begin{aligned}
& \left(\mathbf{U}^{*}-\mathbf{W} \mathbf{V}^{*-1} \mathbf{W}^{T}\right) \delta_{\mathbf{a}}=\epsilon_{\mathbf{a}}-\mathbf{W} \mathbf{V}^{*-1} \epsilon_{\mathbf{b}} \\
& \mathbf{V}^{*} \delta_{\mathbf{b}}=\epsilon_{\mathbf{b}}-\mathbf{W}^{T} \delta_{\mathbf{a}}
\end{aligned}
$$

## Issues in SFM

- Track lifetime
- Nonlinear lens distortion
- Degeneracy and critical surfaces
- Prior knowledge and scene constraints
- Multiple motions

## Track lifetime

every 50th frame of a 800 -frame sequence

## Track lifetime

lifetime of 3192 tracks from the previous sequence

## Track lifetime

track length histogram

## Nonlinear lens distortion

## Nonlinear lens distortion

effect of lens distortion

## Prior knowledge and scene constraintsidive

add a constraint that several lines are parallel

## Prior knowledge and scene constraintisidvFx <br> Prior knowledge and scene constraints

add a constraint that it is a turntable sequence

## Applications of matchmove

## 2d3 boujou

Enemy at the Gate, Double Negative

## Project \#3 MatchMove

- It is more about using tools in this project
- You can choose either calibration or structure from motion to achieve the goal
- Calibration
- Icarus/Voodoo
