Computational photography

wikipedia:

Computational photography refers broadly to computational imaging techniques that enhance or extend the capabilities of digital photography. The output of these techniques is an ordinary photograph, but one that could not have been taken by a traditional camera.

What is computational photography

- Convergence of image processing, computer vision, computer graphics and photography
- Digital photography:
  - Simply mimics traditional sensors and recording by digital technology
  - Involves only simple image processing
- Computational photography
  - More elaborate image manipulation, more computation
  - New types of media (panorama, 3D, etc.)
  - Camera design that take computation into account

Computational photography

Scope

- We can't yet set its precise definition. The following are scopes of what researchers are exploring in this field.
  - Record a richer visual experience
  - Overcome long-standing limitations of conventional cameras
  - Enable new classes of visual signal
 - Enable synthesis impossible photos

Scope
- Image formation
- Color and color perception
Scope

- Panoramic imaging
- Image and video registration
- Spatial warping operations

Scope

- High Dynamic Range Imaging
- Bilateral filtering and HDR display
- Matting

Scope

- Active flash methods
- Lens technology
- Depth and defocus
