Outline

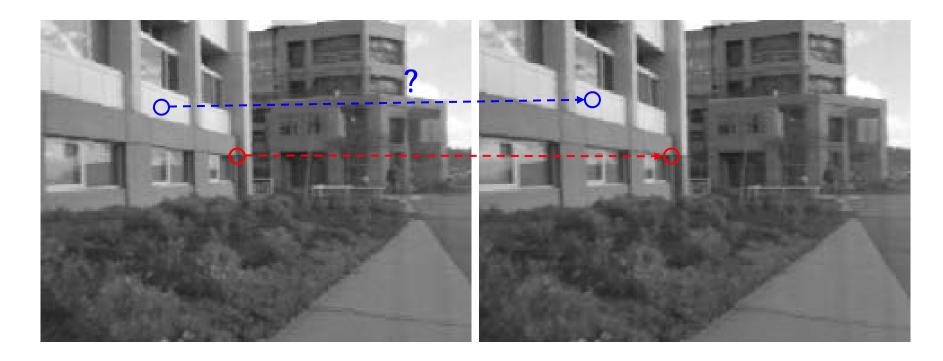

- Features
- Harris corner detector
- SIFT
- Extensions
- Applications

Features

 Also known as interesting points, salient points or keypoints. Points that you can easily point out their correspondences in multiple images using only local information.

Desired properties for features

- Distinctive: a single feature can be correctly matched with high probability.
- Invariant: invariant to scale, rotation, affine, illumination and noise for robust matching across a substantial range of affine distortion, viewpoint change and so on. That is, it is repeatable.

Applications

- Object or scene recognition
- Structure from motion
- Stereo
- Motion tracking
- •

Components

- Feature detection locates where they are
- Feature description describes what they are
- Feature matching decides whether two are the same one

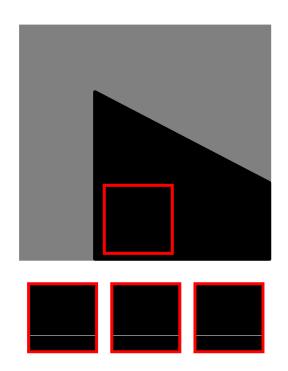

Moravec corner detector (1980)

- We should easily recognize the point by looking through a small window
- Shifting a window in any direction should give a large change in intensity

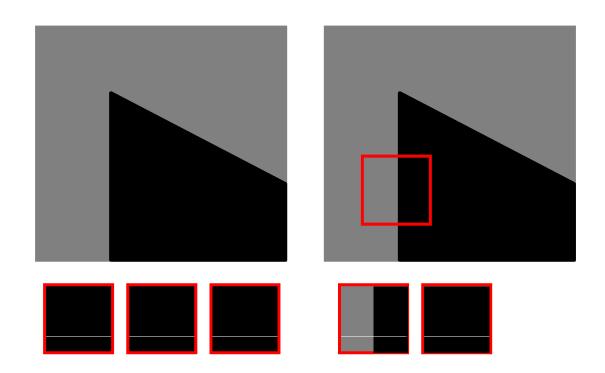

flat

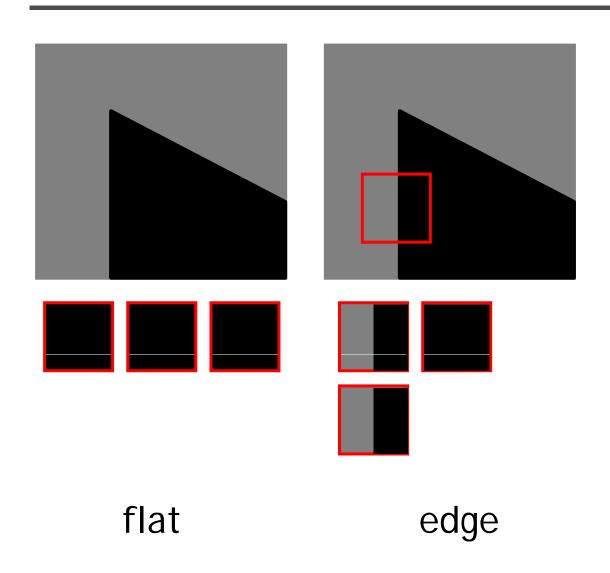

flat

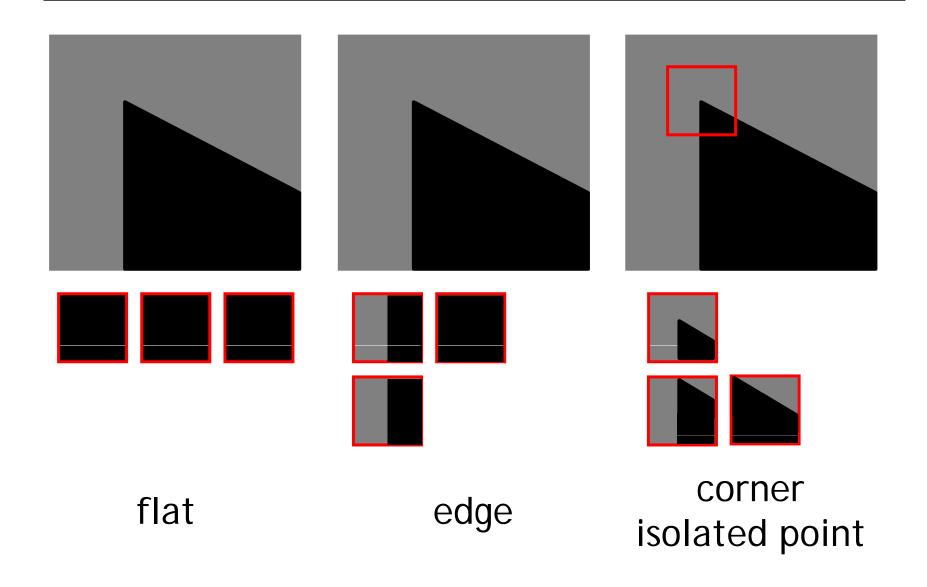

Moravec corner detector

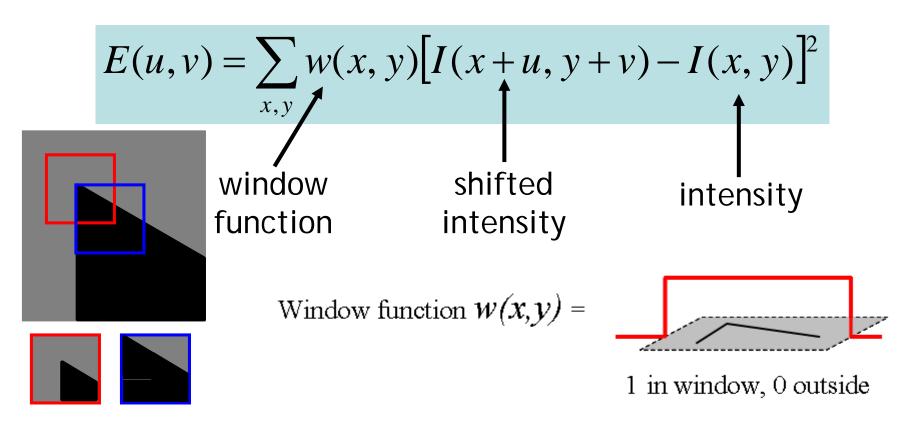

Moravec corner detector

Change of intensity for the shift [u, v]:

Four shifts: (u,v) = (1,0), (1,1), (0,1), (-1, 1)Look for local maxima in $min\{E\}$

Problems of Moravec detector

- Noisy response due to a binary window function
- Only a set of shifts at every 45 degree is considered
- Only minimum of E is taken into account
- ⇒ Harris corner detector (1988) solves these problems.

Noisy response due to a binary window function

> Use a Gaussian function

$$w(x,y) = \exp\left(-\frac{(x^2 + y^2)}{2\sigma^2}\right)$$

Window function
$$w(x,y) =$$

Gaussian

Only a set of shifts at every 45 degree is considered

Consider all small shifts by Taylor's expansion

Only a set of shifts at every 45 degree is considered

> Consider all small shifts by Taylor's expansion

$$E(u,v) = \sum_{x,y} w(x,y) [I(x+u,y+v) - I(x,y)]^{2}$$

$$= \sum_{x,y} w(x,y) [I_{x}u + I_{y}v + O(u^{2},v^{2})]^{2}$$

$$E(u,v) = Au^{2} + 2Cuv + Bv^{2}$$

$$A = \sum_{x,y} w(x,y)I_{x}^{2}(x,y)$$

$$B = \sum_{x,y} w(x,y)I_{y}^{2}(x,y)$$

$$C = \sum_{x,y} w(x,y)I_{x}(x,y)I_{y}(x,y)$$

Equivalently, for small shifts [u, v] we have a *bilinear* approximation:

$$E(u,v) \cong \begin{bmatrix} u & v \end{bmatrix} \mathbf{M} \begin{bmatrix} u \\ v \end{bmatrix}$$

, where M is a 2×2 matrix computed from image derivatives:

$$\mathbf{M} = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

Harris corner detector (matrix form)

$$E(\mathbf{u}) = |I(\mathbf{x_0} + \mathbf{u}) - I(\mathbf{x_0})|^2$$

$$= \left| \left(I_0 + \frac{\partial I}{\partial \mathbf{x}}^T \mathbf{u} \right) - I_0 \right|^2$$

$$= \left| \frac{\partial I}{\partial \mathbf{x}}^T \mathbf{u} \right|^2$$

$$= \mathbf{u}^T \frac{\partial I}{\partial \mathbf{x}} \frac{\partial I}{\partial \mathbf{x}}^T \mathbf{u}$$

$$= \mathbf{u}^T \mathbf{M} \mathbf{u}$$

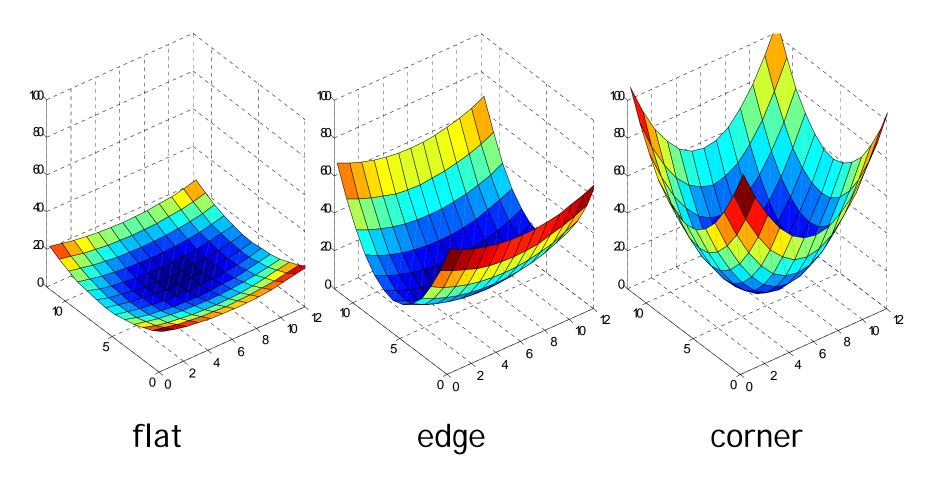

Only minimum of E is taken into account

➤ A new corner measurement by investigating the shape of the error function

 $\mathbf{u}^T \mathbf{M} \mathbf{u}$ represents a quadratic function; Thus, we can analyze E's shape by looking at the property of \mathbf{M}

High-level idea: what shape of the error function will we prefer for features?

Quadratic forms

 Quadratic form (homogeneous polynomial of degree two) of n variables x_i

$$\sum_{i=1}^{n} \sum_{j=1}^{n} c_{ij} x_i x_j$$

$$i \le j$$

Examples

$$4x_1^2 + 5x_2^2 + 3x_3^2 + 2x_1x_2 + 4x_1x_3 + 6x_2x_3$$

$$= (x_1 \quad x_2 \quad x_3) \begin{pmatrix} 4 & 1 & 2 \\ 1 & 5 & 3 \\ 2 & 3 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$

$$\begin{bmatrix} 1 & 5 & 3 \\ 2 & 3 & 3 \end{bmatrix} \begin{bmatrix} x_2 \\ x_3 \end{bmatrix}$$

Symmetric matrices

Quadratic forms can be represented by a real

symmetric matrix
$$\mathbf{A}$$
 where
$$a_{ij} = \begin{cases} c_{ij} & \text{if } i = j, \\ \frac{1}{2}c_{ij} & \text{if } i < j, \\ \frac{1}{2}c_{ji} & \text{if } i > j. \end{cases}$$

$$\sum_{i=1}^{n} \sum_{j=1}^{n} c_{ij}x_ix_j = \sum_{i=1}^{n} \sum_{j=1}^{n} a_{ij}x_ix_j$$

$$= (x_1 \dots x_n) \begin{pmatrix} a_{11} & \dots & a_{1n} \\ \vdots & & \vdots \\ a_{n1} & \dots & a_{nn} \end{pmatrix} \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}$$

$$= \mathbf{x}^t A \mathbf{x}$$

$$= \mathbf{x}^t A \mathbf{x}$$

Eigenvalues of symmetric matrices

suppose $A \in \mathbb{R}^{n \times n}$ is symmetric, *i.e.*, $A = A^T$ fact: the eigenvalues of A are real

suppose
$$Av=\lambda v,\ v\neq 0,\ v\in \mathbf{C}^n$$

$$\overline{v}^TAv=\overline{v}^T(Av)=\lambda\overline{v}^Tv=\lambda\sum_{i=1}^n|v_i|^2$$

$$\overline{v}^TAv=\overline{(Av)}^Tv=\overline{(\lambda v)}^Tv=\overline{\lambda}\sum_{i=1}^n|v_i|^2$$
 we have $\lambda=\overline{\lambda}$ i.e. $\lambda\in \mathbf{P}$

we have $\lambda = \overline{\lambda}$, i.e., $\lambda \in \mathbf{R}$ (hence, can assume $v \in \mathbf{R}^n$)

Eigenvectors of symmetric matrices

suppose $A \in \mathbb{R}^{n \times n}$ is symmetric, *i.e.*, $A = A^T$ fact: there is a set of orthonormal eigenvectors of A

$$A = Q\Lambda Q^T$$

Eigenvectors of symmetric matrices

suppose $A \in \mathbf{R}^{n \times n}$ is symmetric, i.e., $A = A^T$

fact: there is a set of orthonormal eigenvectors of A

$$A = Q\Lambda Q^T$$
$$\mathbf{x}^{\mathsf{T}} \mathbf{A} \mathbf{x}$$

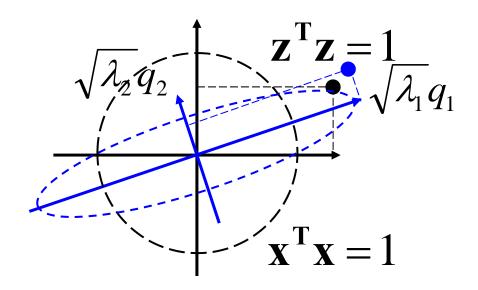

$$= \mathbf{x}^{\mathrm{T}} \mathbf{Q} \, \mathbf{\Lambda} \, \mathbf{Q}^{\mathrm{T}} \mathbf{x}$$

$$= \left(\mathbf{Q}^{\mathsf{T}}\mathbf{x}\right)^{\mathsf{T}}\mathbf{\Lambda}\left(\mathbf{Q}^{\mathsf{T}}\mathbf{x}\right)$$

$$= \mathbf{y}^{\mathrm{T}} \mathbf{\Lambda} \mathbf{y}$$

$$= \left(\Lambda^{\frac{1}{2}} \mathbf{y} \right)^{T} \left(\Lambda^{\frac{1}{2}} \mathbf{y} \right)$$

$$=\mathbf{z}^{\mathrm{T}}\mathbf{z}$$

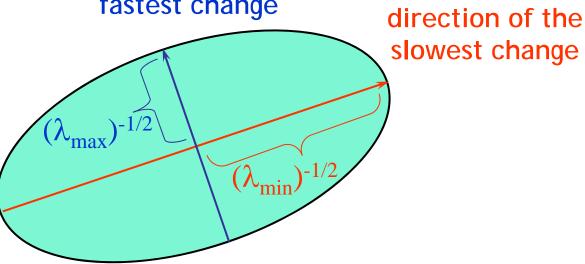

Intensity change in shifting window: eigenvalue analysis

$$E(u,v) \cong \begin{bmatrix} u,v \end{bmatrix} \mathbf{M} \begin{bmatrix} u \\ v \end{bmatrix}$$

$$\lambda_1, \lambda_2$$
 – eigenvalues of ${f M}$

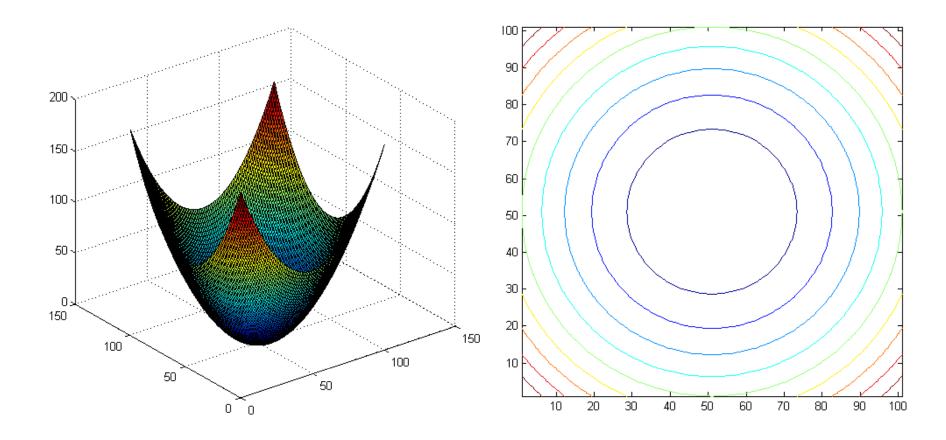

Ellipse E(u, v) = const

direction of the fastest change

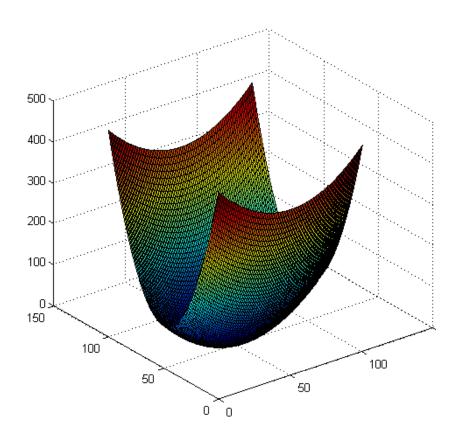

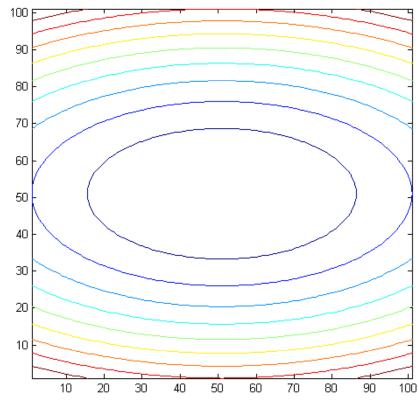

$$\mathbf{A} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}^T$$

$$\mathbf{A} = \begin{bmatrix} 4 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 4 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}^T$$

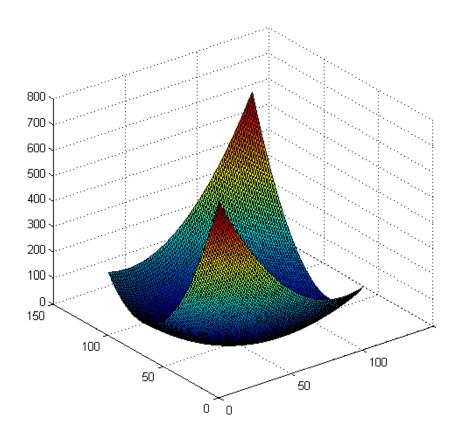

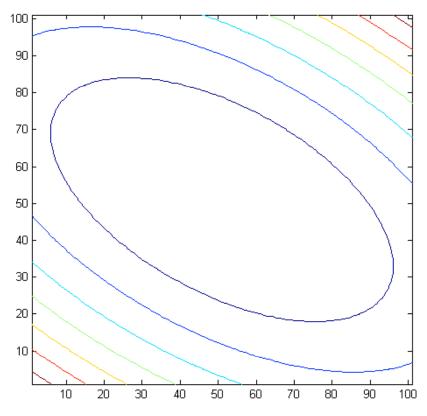

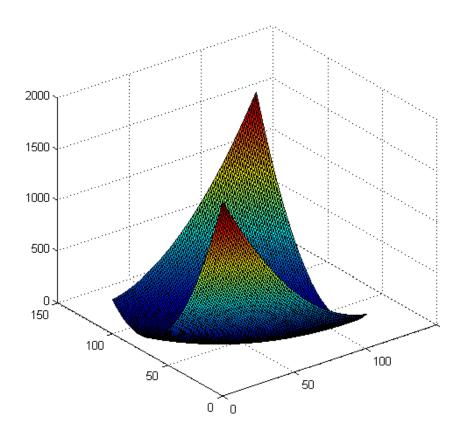

$$\mathbf{A} = \begin{bmatrix} 3.25 & 1.30 \\ 1.30 & 1.75 \end{bmatrix} = \begin{bmatrix} 0.50 & -0.87 \\ -0.87 & -0.50 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} 0.50 & -0.87 \\ -0.87 & -0.50 \end{bmatrix}^{T}$$

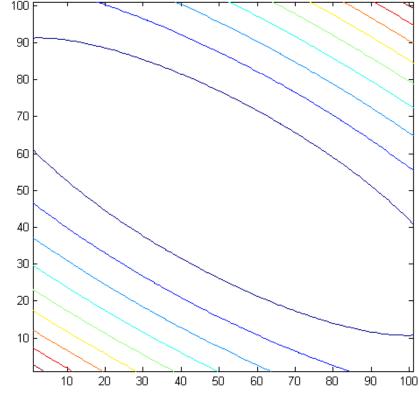

$$\mathbf{A} = \begin{bmatrix} 7.75 & 3.90 \\ 3.90 & 3.25 \end{bmatrix} = \begin{bmatrix} 0.50 & -0.87 \\ -0.87 & -0.50 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 10 \end{bmatrix} \begin{bmatrix} 0.50 & -0.87 \\ -0.87 & -0.50 \end{bmatrix}^T$$

Classification of image points using eigenvalues of **M**:

edge $\lambda_2 \gg \lambda_1$ Corner λ_1 and λ_2 are large, $\lambda_1 \sim \lambda_2$; E increases in all directions flat

 λ_1 and λ_2 are small; E is almost constant in all directions

$$\lambda = \frac{a_{00} + a_{11} \pm \sqrt{(a_{00} - a_{11})^2 + 4a_{10}a_{01}}}{2}$$
 Only for reference you do not need them to compute

Only for reference, them to compute R

Measure of corner response:

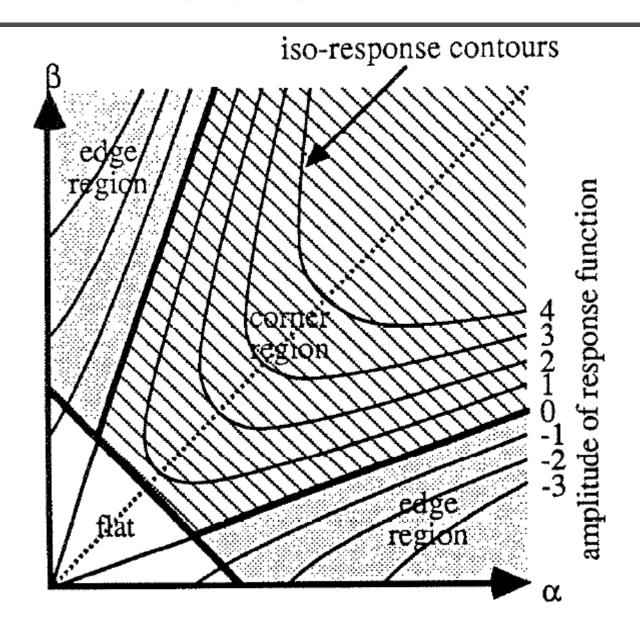

$$R = \det \mathbf{M} - k (\operatorname{trace} \mathbf{M})^2$$

$$\det \mathbf{M} = \lambda_1 \lambda_2$$

$$\operatorname{trace} \mathbf{M} = \lambda_1 + \lambda_2$$

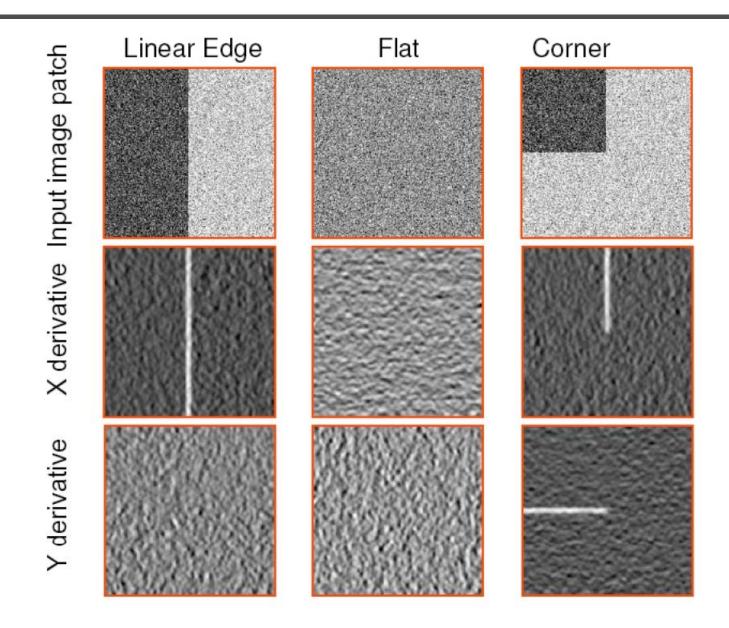

(k - empirical constant, k = 0.04-0.06)

Summary of Harris detector

1. Compute x and y derivatives of image

$$I_{x} = G_{\sigma}^{x} * I \qquad I_{y} = G_{\sigma}^{y} * I$$

2. Compute products of derivatives at every pixel

$$I_{x^2} = I_x \cdot I_x$$
 $I_{y^2} = I_y \cdot I_y$ $I_{xy} = I_x \cdot I_y$

3. Compute the sums of the products of derivatives at each pixel

$$S_{x^2} = G_{\sigma'} * I_{x^2}$$
 $S_{y^2} = G_{\sigma'} * I_{y^2}$ $S_{xy} = G_{\sigma'} * I_{xy}$

Summary of Harris detector

4. Define the matrix at each pixel

$$M(x, y) = \begin{bmatrix} S_{x^2}(x, y) & S_{xy}(x, y) \\ S_{xy}(x, y) & S_{y^2}(x, y) \end{bmatrix}$$

5. Compute the response of the detector at each pixel

$$R = \det M - k(\operatorname{trace}M)^2$$

6. Threshold on value of R; compute nonmax suppression.

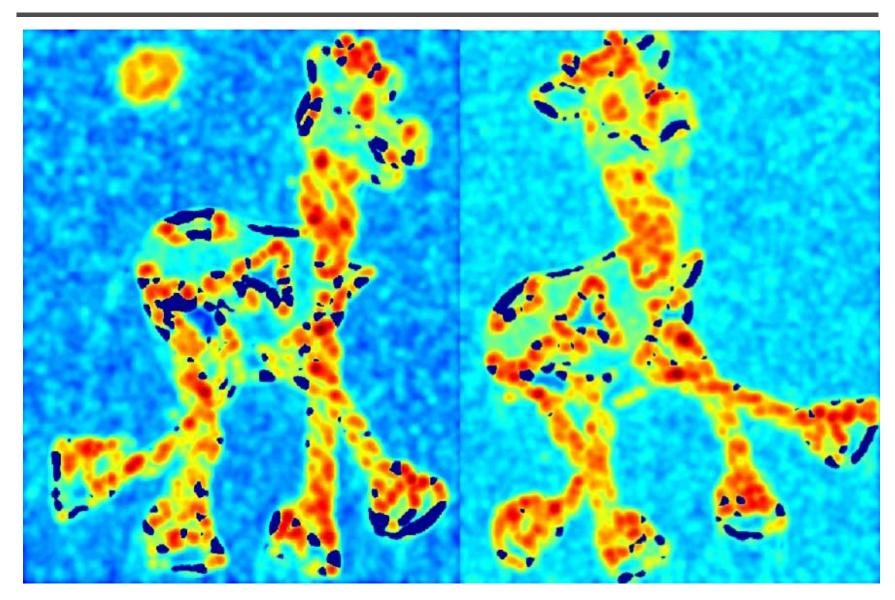

Harris corner detector (input)

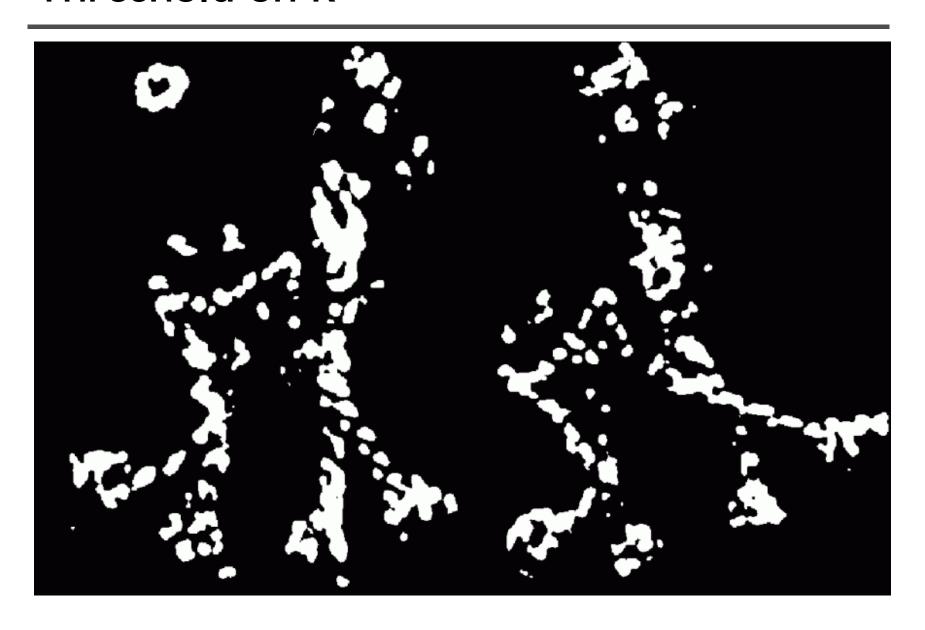

Threshold on R

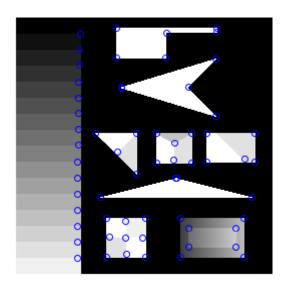

Harris corner detector

http://www.cim.mcgill.ca/~dparks/CornerDetector/mainApplet.htm

Harris detector: summary

• Average intensity change in direction [u, v] can be expressed as a bilinear form:

$$E(u,v) \cong [u,v] \mathbf{M} \begin{bmatrix} u \\ v \end{bmatrix}$$

 Describe a point in terms of eigenvalues of M: measure of corner response

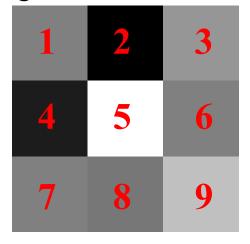

$$R = \lambda_1 \lambda_2 - k(\lambda_1 + \lambda_2)^2$$

• A good (corner) point should have a *large intensity* change in *all directions*, i.e. *R* should be large positive

Now we know where features are

- But, how to match them?
- What is the descriptor for a feature? The simplest solution is the intensities of its spatial neighbors. This might not be robust to brightness change or small shift/rotation.

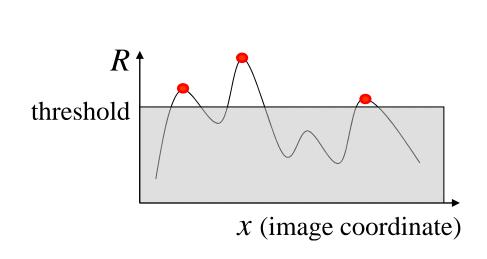

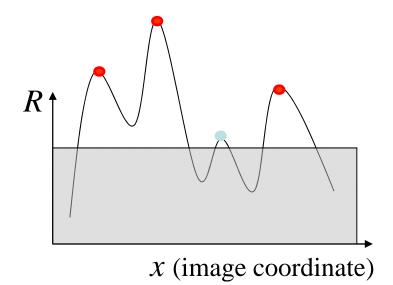

Harris detector: some properties

- Partial invariance to affine intensity change
 - ✓ Only derivatives are used => invariance to intensity shift $I \rightarrow I + b$
 - ✓ Intensity scale: $I \rightarrow aI$

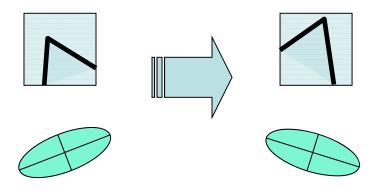

Harris Detector: Some Properties

Rotation invariance

Ellipse rotates but its shape (i.e. eigenvalues) remains the same

Corner response R is invariant to image rotation

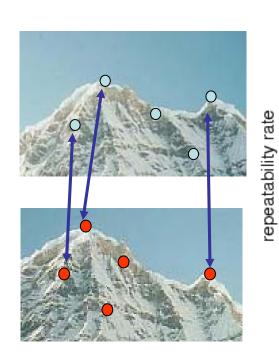

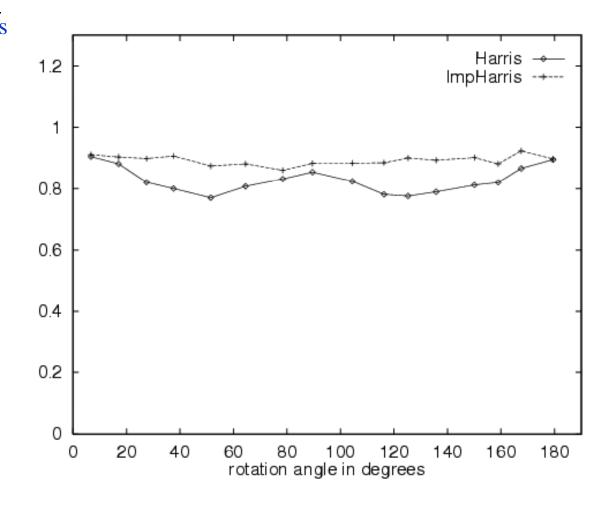

Harris Detector is rotation invariant

Repeatability rate:

correspondences

possible correspondences

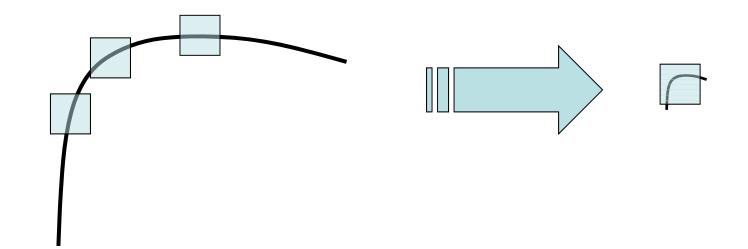

Harris Detector: Some Properties

But: not invariant to image scale!

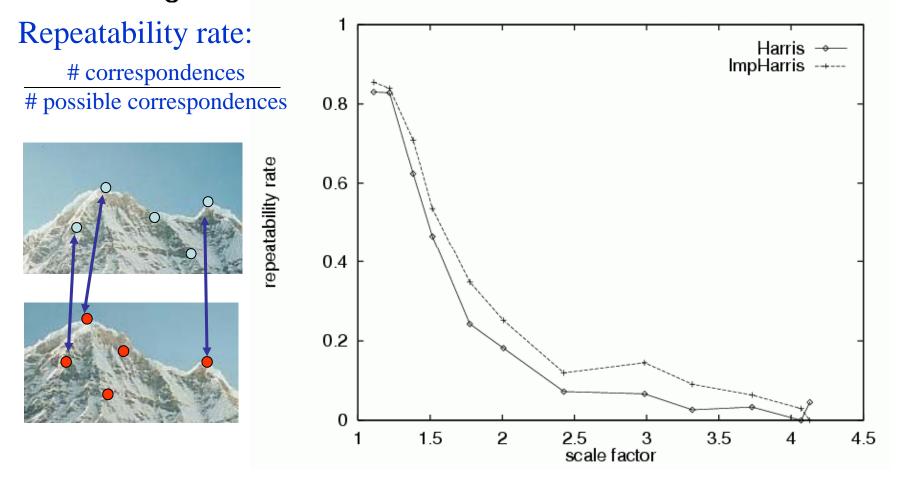

All points will be classified as edges

Corner!

Harris detector: some properties

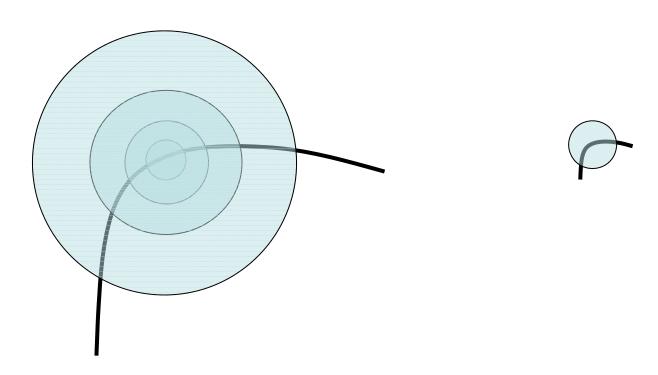

Quality of Harris detector for different scale changes

Scale invariant detection

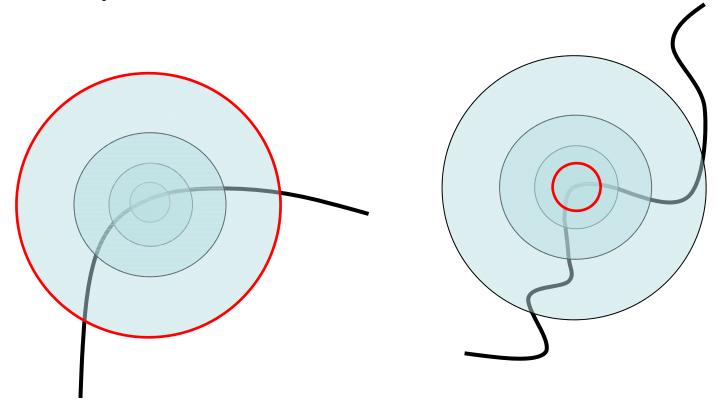

- Consider regions (e.g. circles) of different sizes around a point
- Regions of corresponding sizes will look the same in both images

Scale invariant detection

- The problem: how do we choose corresponding circles independently in each image?
- Aperture problem

SIFT (Scale Invariant Feature Transform)

SIFT

 SIFT is an carefully designed procedure with empirically determined parameters for the invariant and distinctive features.

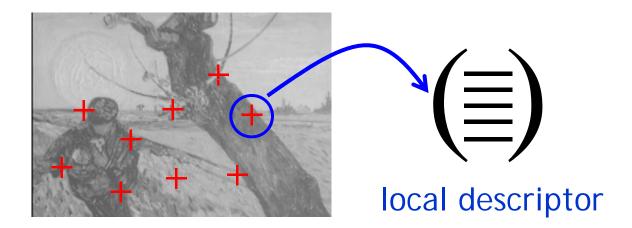

SIFT stages:

Scale-space extrema detection

detector

- Keypoint localization
- Orientation assignment
- Keypoint descriptor

descriptor

A 500x500 image gives about 2000 features

1. Detection of scale-space extrema

- For scale invariance, search for stable features across all possible scales using a continuous function of scale, scale space.
- SIFT uses DoG filter for scale space because it is efficient and as stable as scale-normalized Laplacian of Gaussian.

DoG filtering

Convolution with a variable-scale Gaussian

$$L(x, y, \sigma) = G(x, y, \sigma) * I(x, y),$$

$$G(x, y, \sigma) = 1/(2\pi\sigma^2) \exp^{-(x^2 + y^2)/\sigma^2}$$

Difference-of-Gaussian (DoG) filter

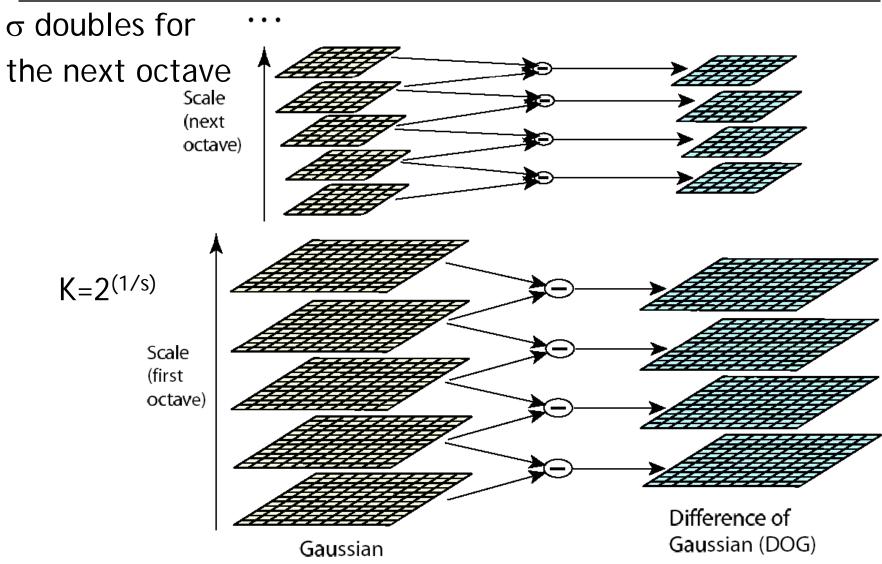

$$G(x, y, k\sigma) - G(x, y, \sigma)$$

Convolution with the DoG filter

$$\begin{array}{lcl} D(x,y,\sigma) & = & (G(x,y,k\sigma) - G(x,y,\sigma)) * I(x,y) \\ & = & L(x,y,k\sigma) - L(x,y,\sigma). \end{array}$$

Scale space

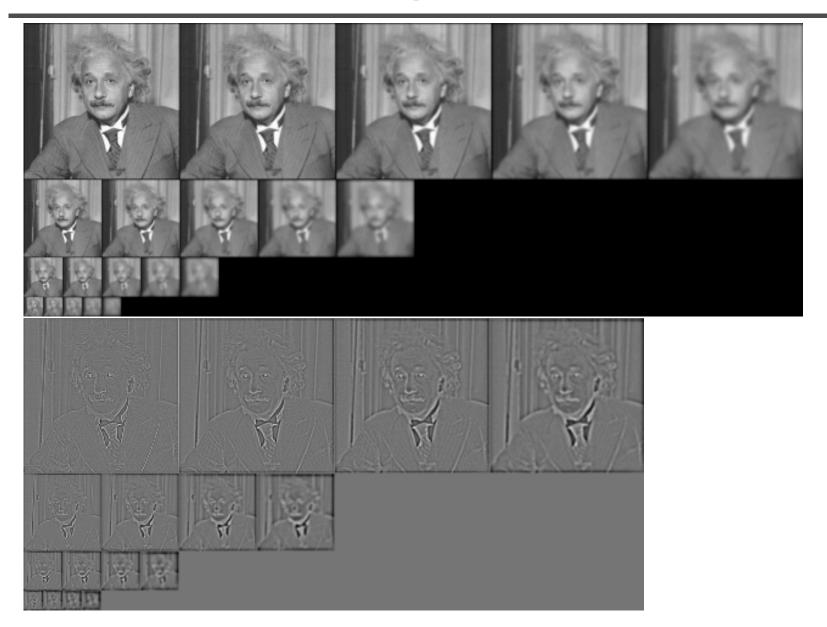

Dividing into octave is for efficiency only.

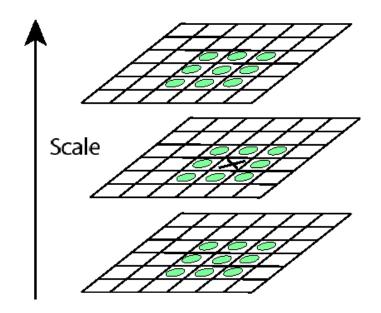

Detection of scale-space extrema

X is selected if it is larger or smaller than all 26 neighbors

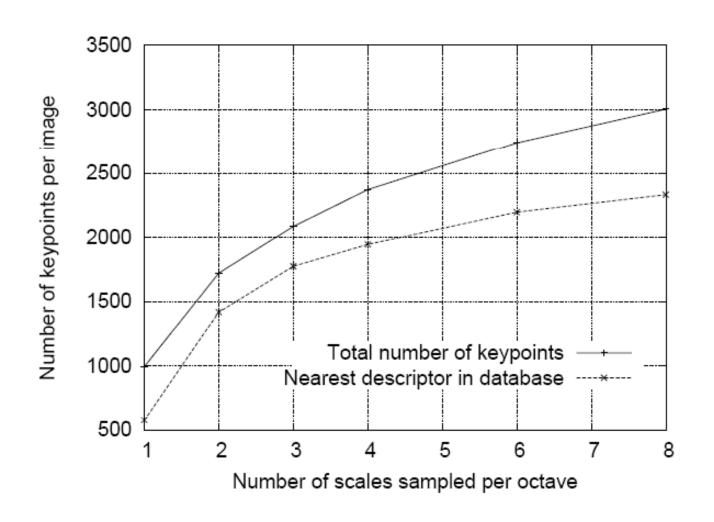

Decide scale sampling frequency

- It is impossible to sample the whole space, tradeoff efficiency with completeness.
- Decide the best sampling frequency by experimenting on 32 real image subject to synthetic transformations. (rotation, scaling, affine stretch, brightness and contrast change, adding noise...)

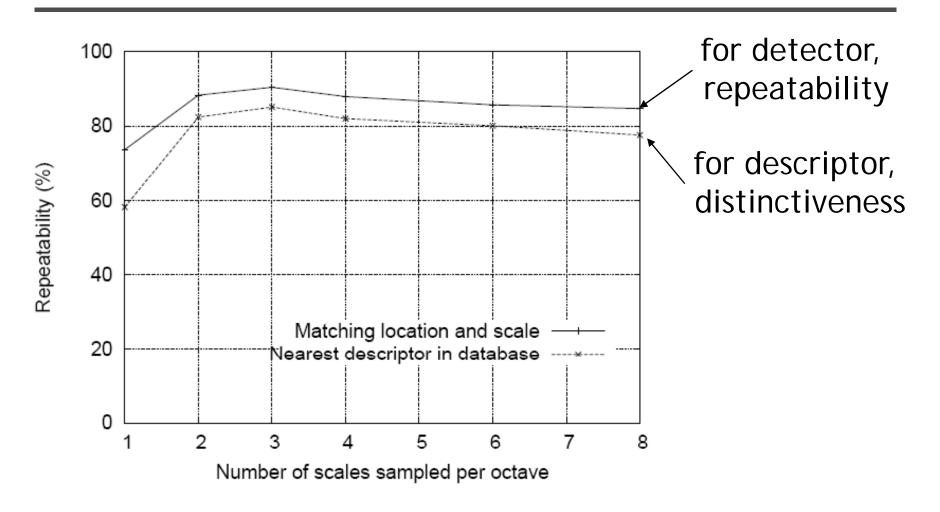

Decide scale sampling frequency

DigiVFX

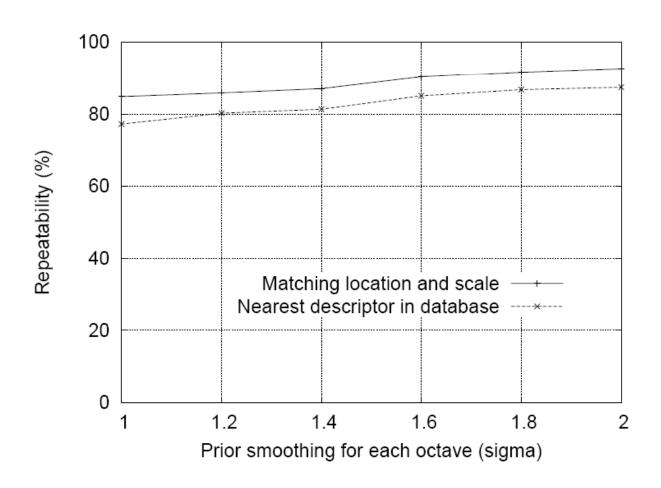

Decide scale sampling frequency

s=3 is the best, for larger s, too many unstable features

Pre-smoothing

 σ =1.6, plus a double expansion

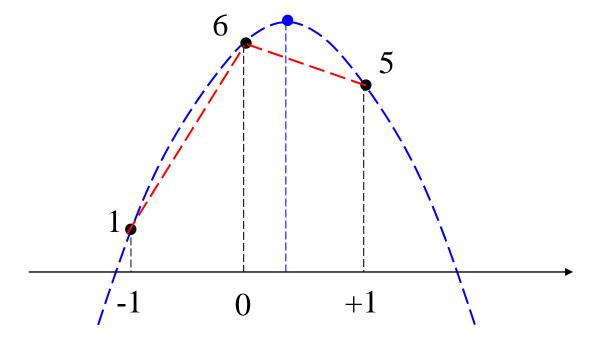

2. Accurate keypoint localization

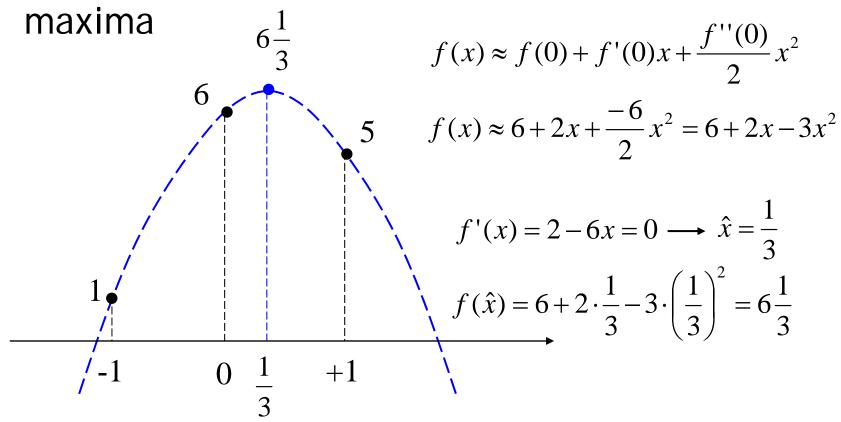

- Reject points with low contrast (flat) and poorly localized along an edge (edge)
- Fit a 3D quadratic function for sub-pixel maxima

2. Accurate keypoint localization

- Reject points with low contrast (flat) and poorly localized along an edge (edge)
- Fit a 3D quadratic function for sub-pixel

2. Accurate keypoint localization

Taylor series of several variables

$$T(x_1,\cdots,x_d) = \sum_{n_1=0}^{\infty}\cdots\sum_{n_d=0}^{\infty}\frac{\partial^{n_1}}{\partial x_1^{n_1}}\cdots\frac{\partial^{n_d}}{\partial x_d^{n_d}}\frac{f(a_1,\cdots,a_d)}{n_1!\cdots n_d!}(x_1-a_1)^{n_1}\cdots(x_d-a_d)^{n_d}$$

Two variables

$$f(x,y) \approx f(0,0) + \left(\frac{\partial f}{\partial x}x + \frac{\partial f}{\partial y}y\right) + \frac{1}{2}\left(\frac{\partial^2 f}{\partial x \partial x}x^2 + 2\frac{\partial^2 f}{\partial x \partial y}xy + \frac{\partial^2 f}{\partial y \partial y}y^2\right)$$

$$f\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) \approx f\left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}\right) + \left[\frac{\partial f}{\partial x} \quad \frac{\partial f}{\partial y}\right]\begin{bmatrix} x \\ y \end{bmatrix} + \frac{1}{2}\begin{bmatrix} x \quad y \end{bmatrix} \begin{bmatrix} \frac{\partial^2 f}{\partial x \partial x} & \frac{\partial^2 f}{\partial x \partial y} \\ \frac{\partial^2 f}{\partial x \partial y} & \frac{\partial^2 f}{\partial y \partial y} \end{bmatrix}\begin{bmatrix} x \\ y \end{bmatrix}$$

$$f(\mathbf{x}) \approx f(\mathbf{0}) + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2}\mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x}$$

Accurate keypoint localization

 Taylor expansion in a matrix form, x is a vector, f maps x to a scalar

$$f \text{ maps } \mathbf{x} \text{ to a scalar}$$

$$f(\mathbf{x}) = f + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2} \mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x} \quad \text{Hessian matrix (often symmetric)}$$

$$\begin{cases} \frac{\partial f}{\partial x_1} \\ \frac{\partial f}{\partial x_1} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{cases}$$

$$\begin{cases} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \cdots & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_n^2} \end{cases}$$

2D illustration

$$f(\mathbf{x}) = f + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2} \mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x}$$

$f_{-1,1}$	$f_{0,1}$	$f_{1,1}$
$f_{-1,0}$	$f_{0,0}$	$f_{1,0}$
$\boxed{f_{-1,-1}}$	$f_{0,-1}$	$f_{1,-1}$

$$\frac{\partial f}{\partial x} = (f_{1,0} - f_{-1,0})/2$$

$$\frac{\partial f}{\partial y} = (f_{0,1} - f_{0,-1})/2$$

$$\frac{\partial^2 f}{\partial x^2} = f_{1,0} - 2f_{0,0} + f_{-1,0}$$

$$\frac{\partial^2 f}{\partial y^2} = f_{0,1} - 2f_{0,0} + f_{0,-1}$$

$$\frac{\partial^2 f}{\partial x \partial y} = (f_{-1,-1} - f_{-1,1} - f_{1,-1} + f_{1,1})/4$$

2D example

$$f(\mathbf{x}) = f + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2} \mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x}$$

$$\frac{\partial f}{\partial \mathbf{x}} = \frac{\partial f}{\partial \mathbf{x}} + \frac{1}{2} \left(\frac{\partial^2 f}{\partial \mathbf{x}^2} + \frac{\partial^2 f}{\partial \mathbf{x}^2} \right) x = \frac{\partial f}{\partial \mathbf{x}} + \frac{\partial^2 f}{\partial \mathbf{x}^2} x$$

$$\mathbf{x}_m = -\frac{\partial^2 f}{\partial \mathbf{x}^2}^{-1} \frac{\partial f}{\partial \mathbf{x}}$$

Accurate keypoint localization

$$f(\mathbf{x}) = f + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2} \mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x}$$

- x is a 3-vector
- Change sample point if offset is larger than 0.5
- Throw out low contrast (<0.03)

Accurate keypoint localization

• Throw out low contrast $|D(\hat{\mathbf{x}})| < 0.03$

$$D(\hat{\mathbf{x}}) = D + \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}} + \frac{1}{2} \hat{\mathbf{x}}^{T} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}} \hat{\mathbf{x}}$$

$$= D + \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}} + \frac{1}{2} \left(-\frac{\partial^{2} D}{\partial \mathbf{x}^{2}}^{-1} \frac{\partial D}{\partial \mathbf{x}} \right)^{T} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}} \left(-\frac{\partial^{2} D}{\partial \mathbf{x}^{2}}^{-1} \frac{\partial D}{\partial \mathbf{x}} \right)$$

$$= D + \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}} + \frac{1}{2} \frac{\partial D}{\partial \mathbf{x}}^{T} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}}^{-T} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}}^{-1} \frac{\partial D}{\partial \mathbf{x}}$$

$$= D + \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}} + \frac{1}{2} \frac{\partial D}{\partial \mathbf{x}}^{T} \frac{\partial^{2} D}{\partial \mathbf{x}^{2}}^{-1} \frac{\partial D}{\partial \mathbf{x}}$$

$$= D + \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}} + \frac{1}{2} \frac{\partial D}{\partial \mathbf{x}}^{T} (-\hat{\mathbf{x}})$$

$$= D + \frac{1}{2} \frac{\partial D}{\partial \mathbf{x}}^{T} \hat{\mathbf{x}}$$

Eliminating edge responses

$$\mathbf{H} = \begin{bmatrix} D_{xx} & D_{xy} \\ D_{xy} & D_{yy} \end{bmatrix}$$
 Hessian matrix at keypoint location

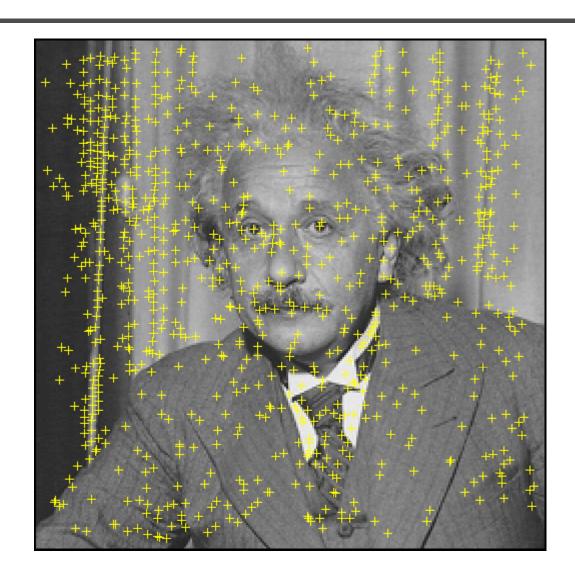

$$Tr(\mathbf{H}) = D_{xx} + D_{yy} = \alpha + \beta,$$
$$Det(\mathbf{H}) = D_{xx}D_{yy} - (D_{xy})^2 = \alpha\beta.$$

Let
$$\alpha = r\beta$$
 $\frac{\text{Tr}(\mathbf{H})^2}{\text{Det}(\mathbf{H})} = \frac{(\alpha + \beta)^2}{\alpha\beta} = \frac{(r\beta + \beta)^2}{r\beta^2} = \frac{(r+1)^2}{r}$

Keep the points with
$$\frac{\operatorname{Tr}(\mathbf{H})^2}{\operatorname{Det}(\mathbf{H})} < \frac{(r+1)^2}{r}$$
. r=10

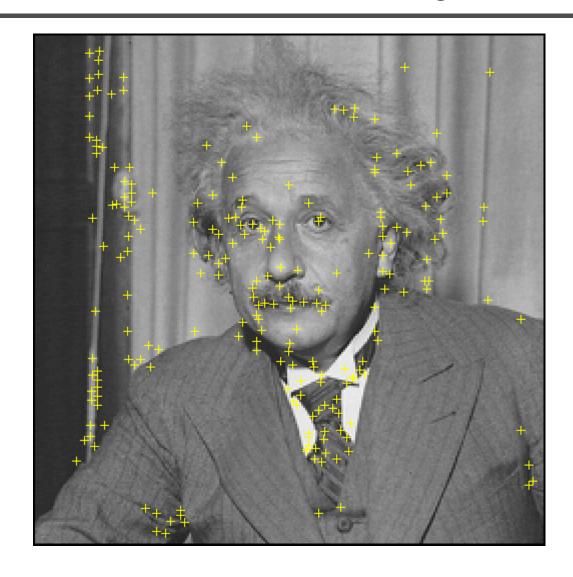

Maxima in D

Remove low contrast and edges

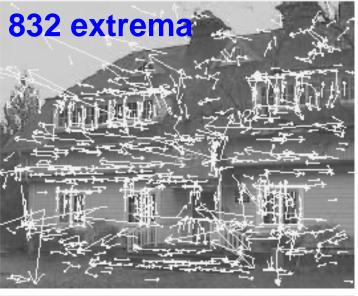

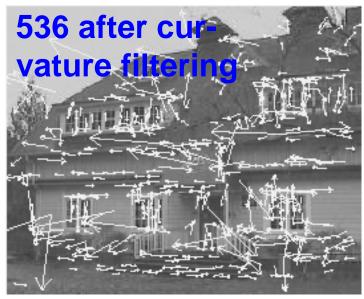

Keypoint detector

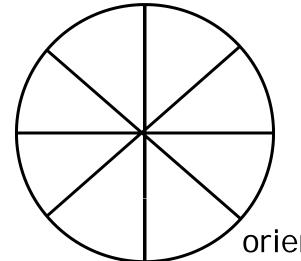

DigiVFX

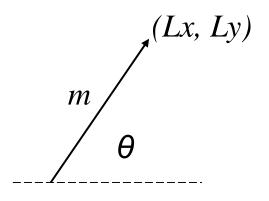

3. Orientation assignment

- By assigning a consistent orientation, the keypoint descriptor can be orientation invariant.
- For a keypoint, L is the Gaussian-smoothed image with the closest scale,

$$m(x,y) = \sqrt{(L(x+1,y) - L(x-1,y))^2 + (L(x,y+1) - L(x,y-1))^2}$$

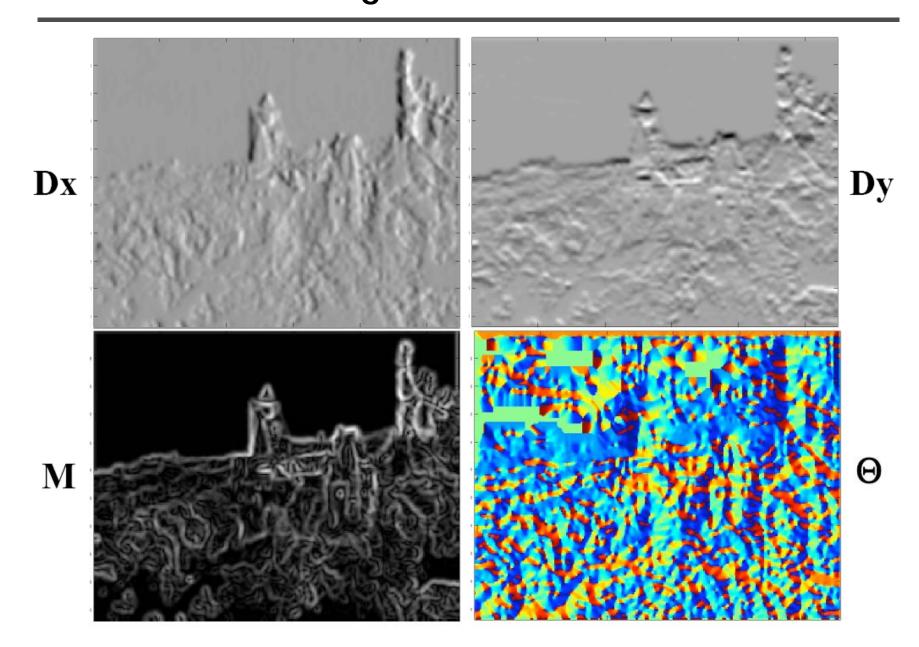

$$\theta(x,y) = \tan^{-1}((L(x,y+1) - L(x,y-1))/(L(x+1,y) - L(x-1,y)))$$

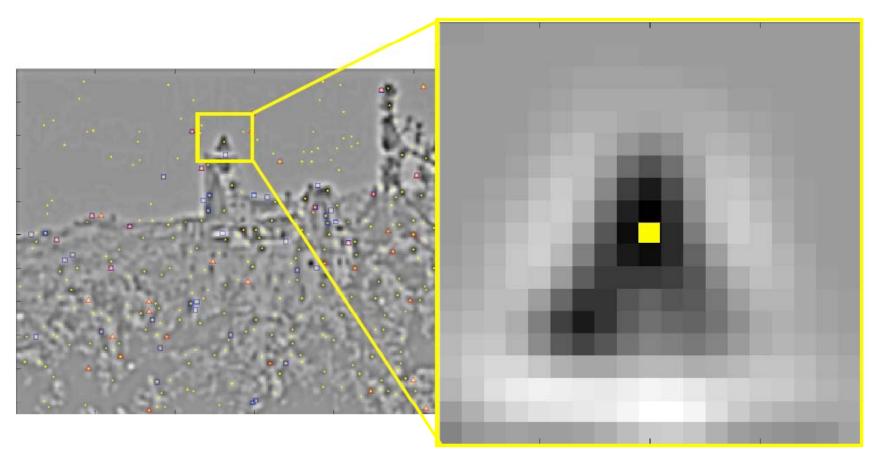

orientation histogram (36 bins)

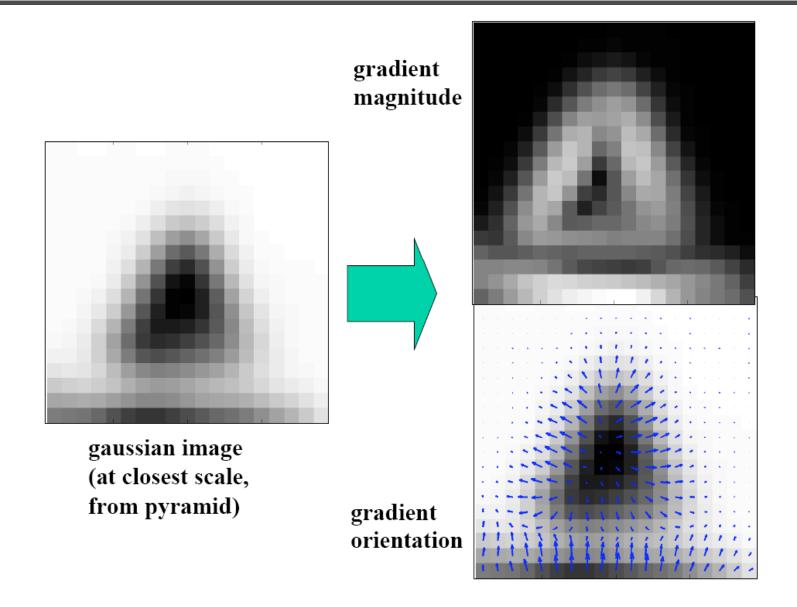

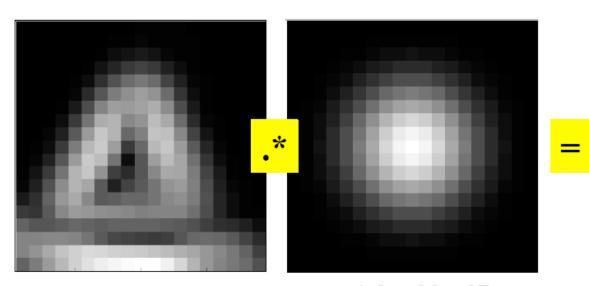

- •Keypoint location = extrema location
- •Keypoint scale is scale of the DOG image

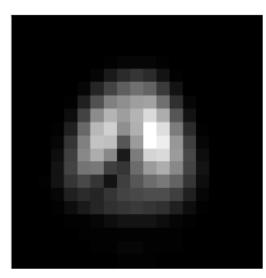

gradient magnitude

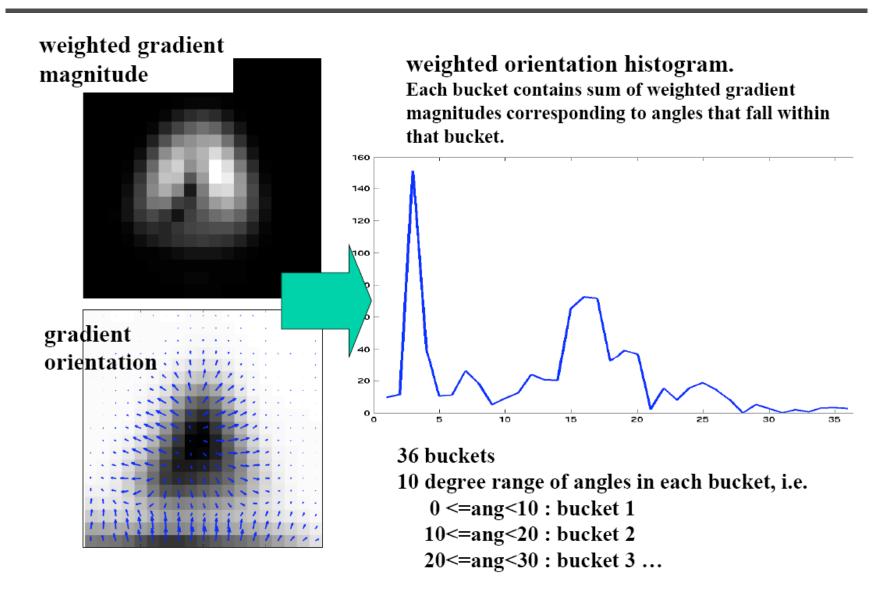

weighted by 2D gaussian kernel

σ=1.5*scale of the keypoint

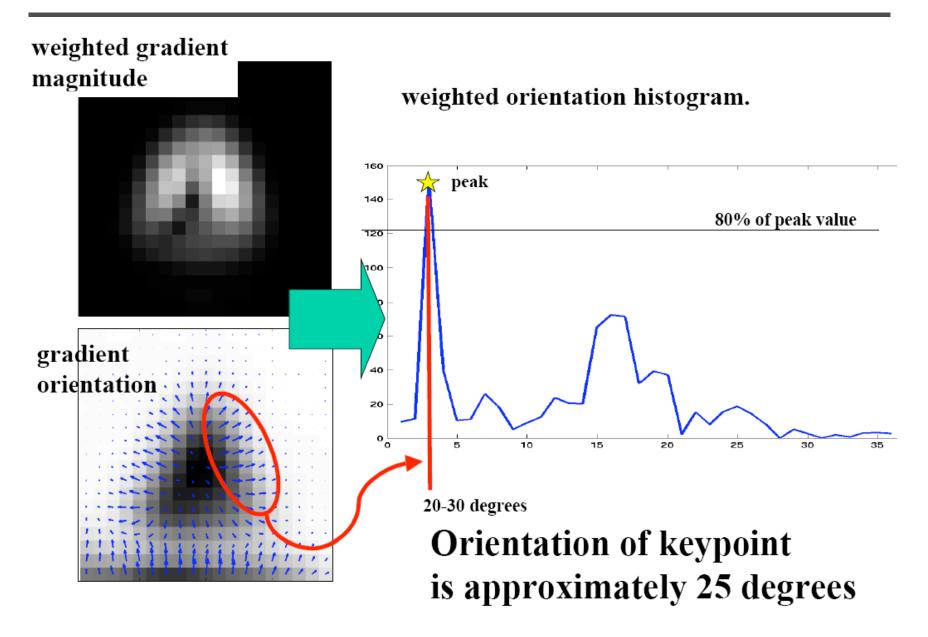

weighted gradient magnitude

DigiVFX

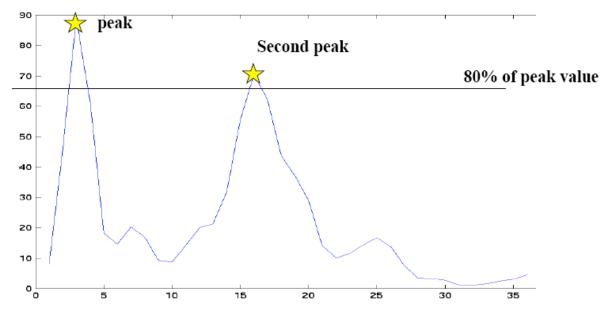

There may be multiple orientations.

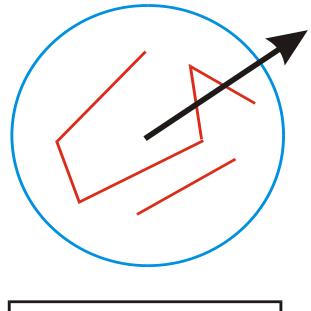

accurate peak position is determined by fitting

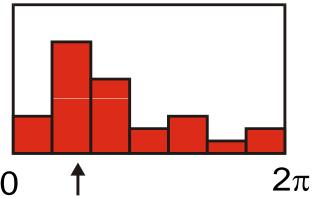

In this case, generate duplicate keypoints, one with orientation at 25 degrees, one at 155 degrees.

Design decision: you may want to limit number of possible multiple peaks to two.

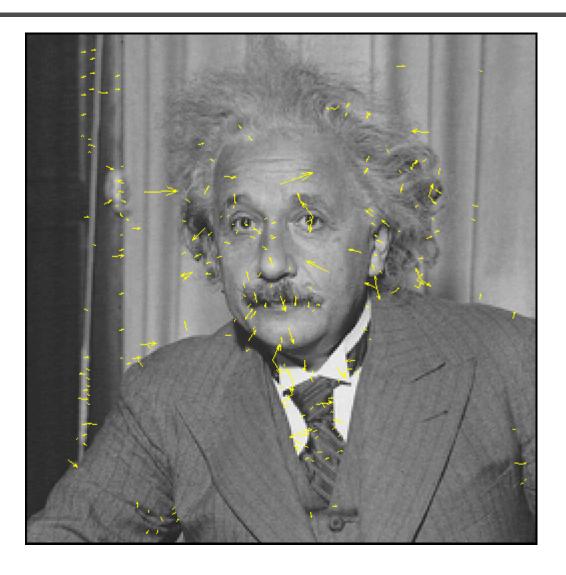

36-bin orientation histogram over 360°, weighted by m and 1.5*scale falloff Peak is the orientation

Local peak within 80% creates multiple orientations

About 15% has multiple orientations and they contribute a lot to stability

4. Local image descriptor

- Thresholded image gradients are sampled over 16x16 array of locations in scale space
- Create array of orientation histograms (w.r.t. key orientation)
- 8 orientations x 4x4 histogram array = 128 dimensions
- Normalized, clip values larger than 0.2, renormalize

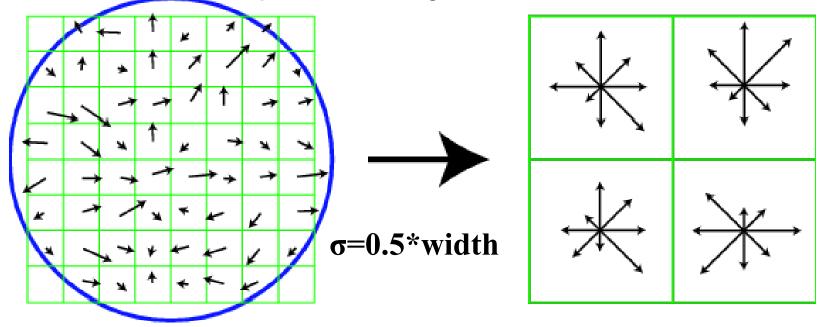

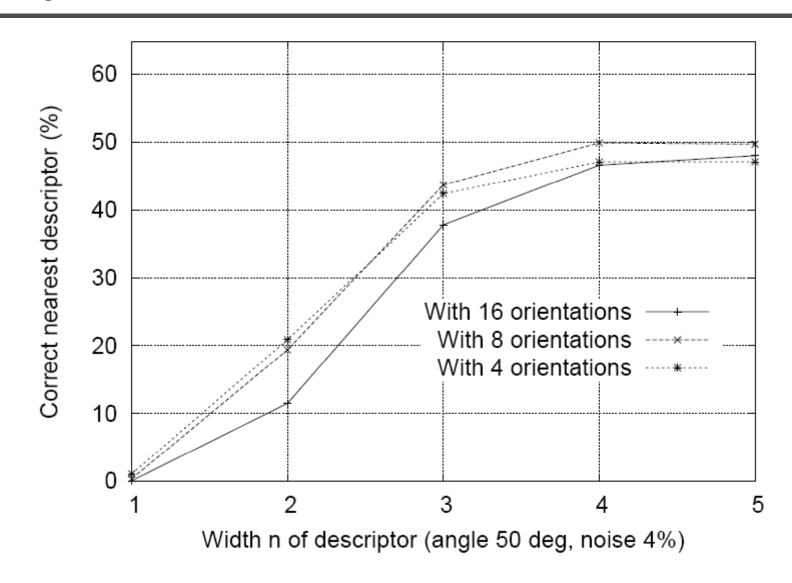

Image gradients

Keypoint descriptor

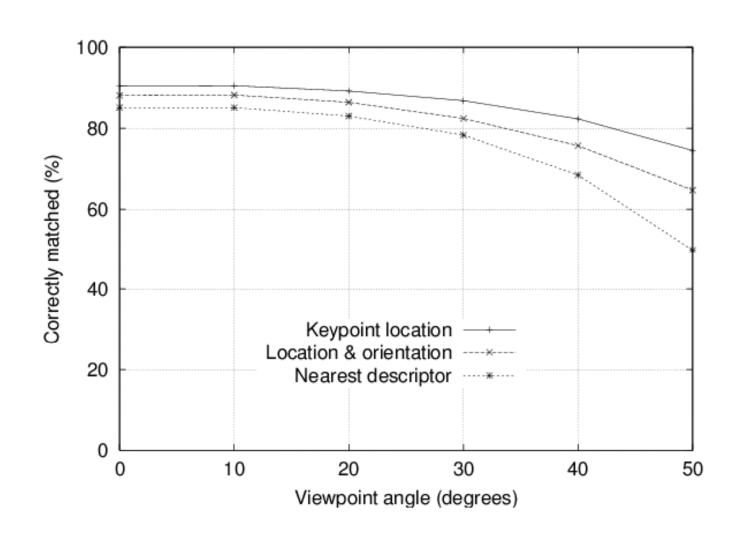

Why 4x4x8?

Sensitivity to affine change

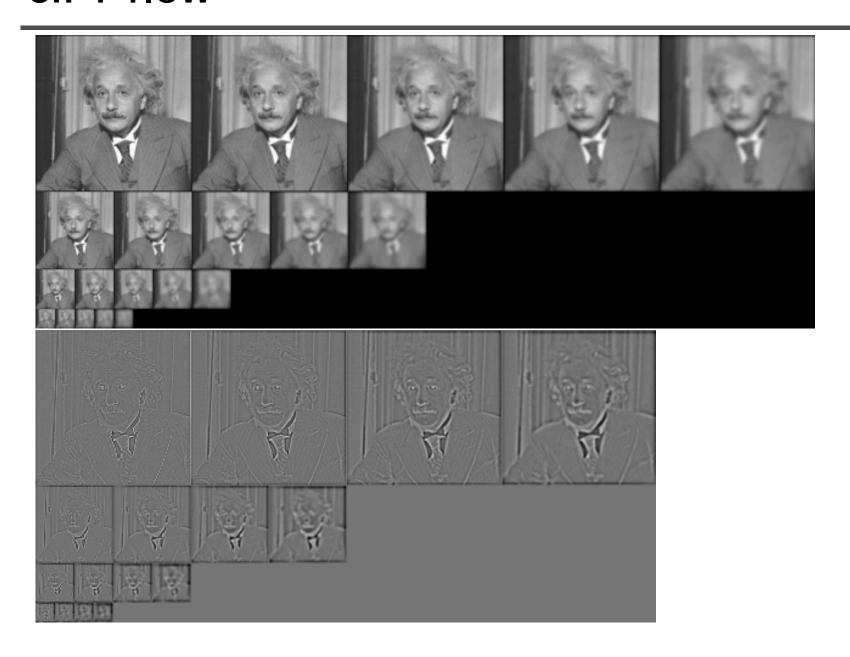

Feature matching

• for a feature x, he found the closest feature x_1 and the second closest feature x_2 . If the distance ratio of $d(x, x_1)$ and $d(x, x_1)$ is smaller than 0.8, then it is accepted as a match.

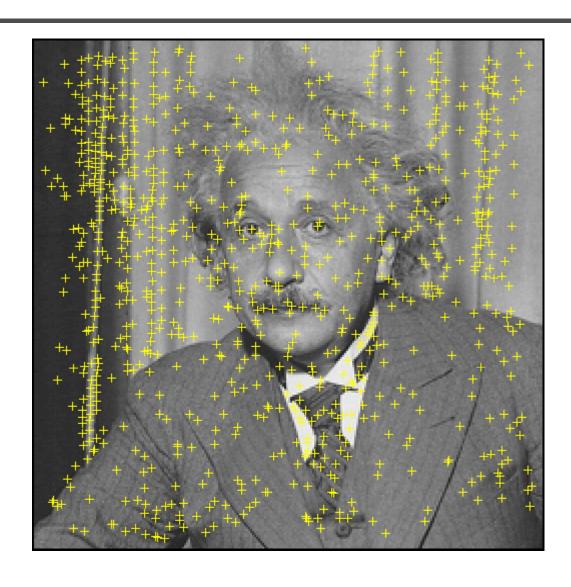

SIFT flow

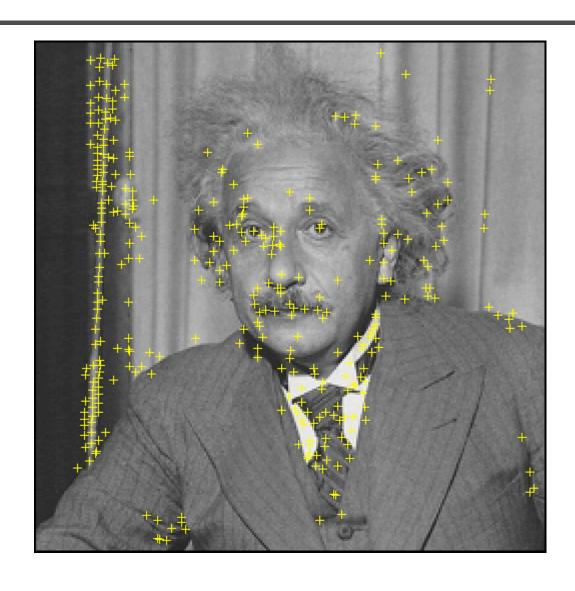

Maxima in D

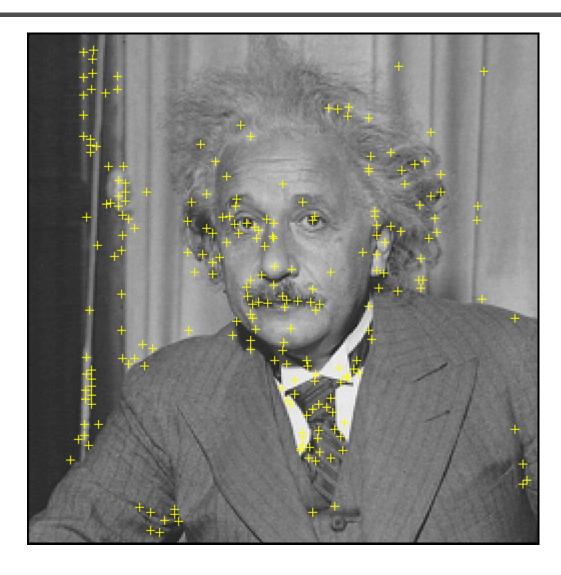

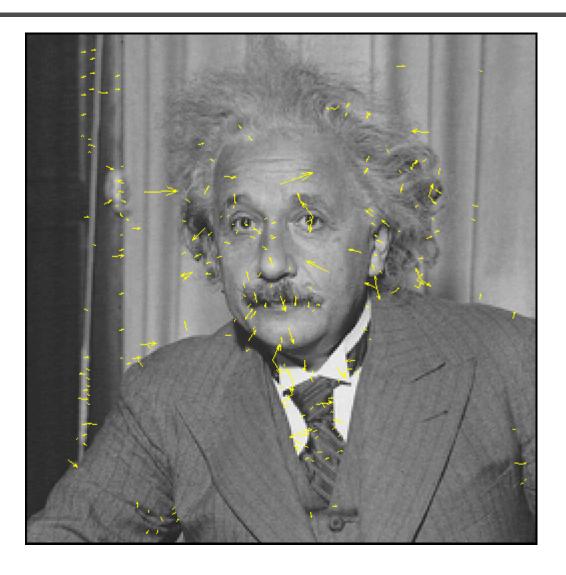

DigiVFX

Estimated rotation

 Computed affine transformation from rotated image to original image:

```
0.7060 -0.7052 128.4230
0.7057 0.7100 -128.9491
0 0 1.0000
```

Actual transformation from rotated image to original image:

```
0.7071 -0.7071 128.6934
0.7071 0.7071 -128.6934
0 0 1.0000
```

SIFT extensions

Average face:

Top ten eigenfaces (left = highest eigenvalue, right = lowest eigenvalue):

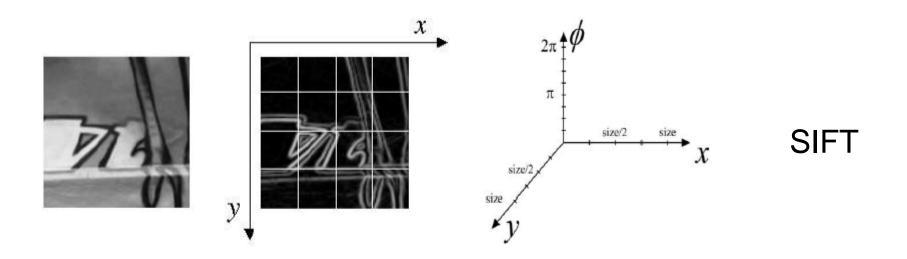

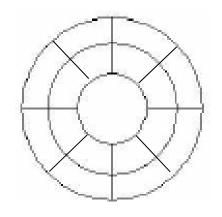

PCA-SIFT

- Only change step 4
- Pre-compute an eigen-space for local gradient patches of size 41x41
- 2x39x39=3042 elements
- Only keep 20 components
- A more compact descriptor

GLOH (Gradient location-orientation histogram)

17 location bins 16 orientation bins Analyze the 17x16=272-d eigen-space, keep 128 components

SIFT is still considered the best.

Multi-Scale Oriented Patches

- Simpler than SIFT. Designed for image matching.
 [Brown, Szeliski, Winder, CVPR'2005]
- Feature detector
 - Multi-scale Harris corners
 - Orientation from blurred gradient
 - Geometrically invariant to rotation
- Feature descriptor
 - Bias/gain normalized sampling of local patch (8x8)
 - Photometrically invariant to affine changes in intensity

DigiVFX

Multi-Scale Harris corner detector

 Image stitching is mostly concerned with matching images that have the same scale, so sub-octave pyramid might not be necessary.

Multi-Scale Harris corner detector

$$\mathbf{H}_{l}(x,y) = \nabla_{\sigma_{d}} P_{l}(x,y) \nabla_{\sigma_{d}} P_{l}(x,y)^{T} * g_{\sigma_{i}}(x,y)$$

$$\nabla_{\sigma} f(x,y) \triangleq \nabla f(x,y) * g_{\sigma}(x,y)$$
 smoother version of gradients

$$\sigma_i = 1.5$$
 $\sigma_d = 1.0$

Corner detection function:

$$f_{HM}(x,y) = \frac{\det \mathbf{H}_l(x,y)}{\operatorname{tr} \mathbf{H}_l(x,y)} = \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$$

Pick local maxima of 3x3 and larger than 10

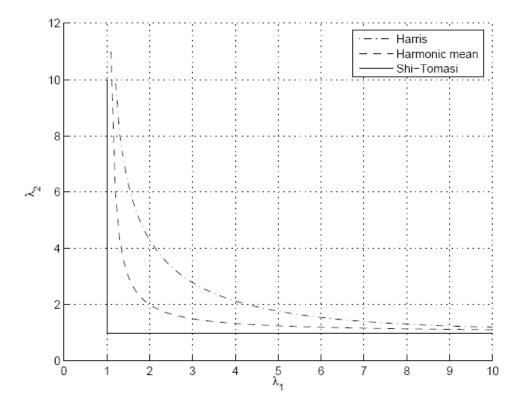

Keypoint detection function

Harris
$$f_H = \lambda_1 \lambda_2 - 0.04(\lambda_1 + \lambda_2)^2 = \det \mathbf{H} - 0.04(\operatorname{tr} \mathbf{H})^2$$

Harmonic mean
$$f_{HM} = \lambda_1 \lambda_2 / (\lambda_1 + \lambda_2) = \det \mathbf{H} / \operatorname{tr} \mathbf{H}$$

Shi-Tomasi
$$f_{ST} = \min(\lambda_1, \lambda_2)$$

Experiments show roughly the same performance.

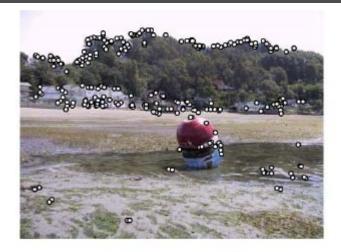

Non-maximal suppression

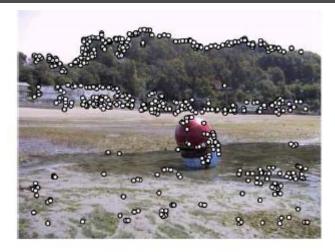

- Restrict the maximal number of interest points, but also want them spatially well distributed
- Only retain maximums in a neighborhood of radius r.
- Sort them by strength, decreasing *r* from infinity until the number of keypoints (500) is satisfied.

Digi<mark>VFX</mark>

Non-maximal suppression

(a) Strongest 250

(b) Strongest 500

(c) ANMS 250, r=24

(d) ANMS 500, r = 16

D

Sub-pixel refinement

$$f(\mathbf{x}) = f + \frac{\partial f}{\partial \mathbf{x}}^T \mathbf{x} + \frac{1}{2} \mathbf{x}^T \frac{\partial^2 f}{\partial \mathbf{x}^2} \mathbf{x}$$

$$\mathbf{x}_m = -\frac{\partial^2 f}{\partial \mathbf{x}^2}^{-1} \frac{\partial f}{\partial \mathbf{x}}$$

$f_{-1,1}$	$f_{0,1}$	$f_{1,1}$
$f_{-1,0}$	$f_{0,0}$	$f_{1,0}$
$f_{-1,-1}$	$f_{0,-1}$	$f_{1,-1}$

$$\frac{\partial f}{\partial x} = (f_{1,0} - f_{-1,0})/2$$

$$\frac{\partial f}{\partial y} = (f_{0,1} - f_{0,-1})/2$$

$$\frac{\partial^2 f}{\partial x^2} = f_{1,0} - 2f_{0,0} + f_{-1,0}$$

$$\frac{\partial^2 f}{\partial y^2} = f_{0,1} - 2f_{0,0} + f_{0,-1}$$

$$\frac{\partial^2 f}{\partial x \partial y} = (f_{-1,-1} - f_{-1,1} - f_{1,-1} + f_{1,1})/4$$

Orientation assignment

Orientation = blurred gradient

$$\mathbf{u}_l(x,y) = \nabla_{\sigma_o} P_l(x,y)$$
$$\sigma_o = 4.5$$

$$[\cos \theta, \sin \theta] = \mathbf{u}/|\mathbf{u}|$$

Descriptor Vector

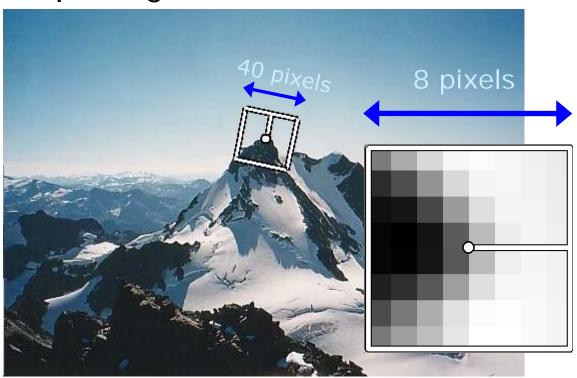

- Rotation Invariant Frame
 - Scale-space position (x, y, s) + orientation (θ)

DigiVFX

MOPS descriptor vector

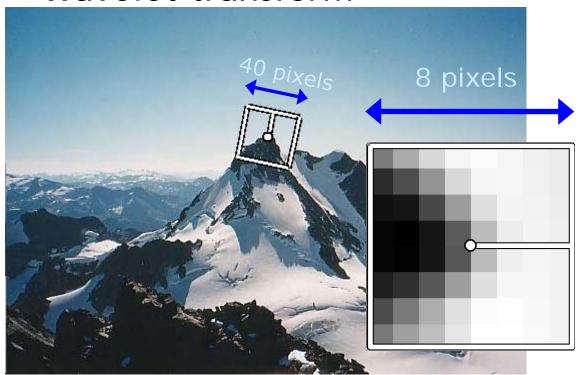

- 8x8 oriented patch sampled at 5 x scale. See TR for details.
- Sampled from $P_l(x,y)*g_{2\times\sigma_p}(x,y)$ with spacing=5

DigiVFX

MOPS descriptor vector

- 8x8 oriented patch sampled at 5 x scale. See TR for details.
- Bias/gain normalisation: $I' = (I \mu)/\sigma$
- Wavelet transform

Detections at multiple scales

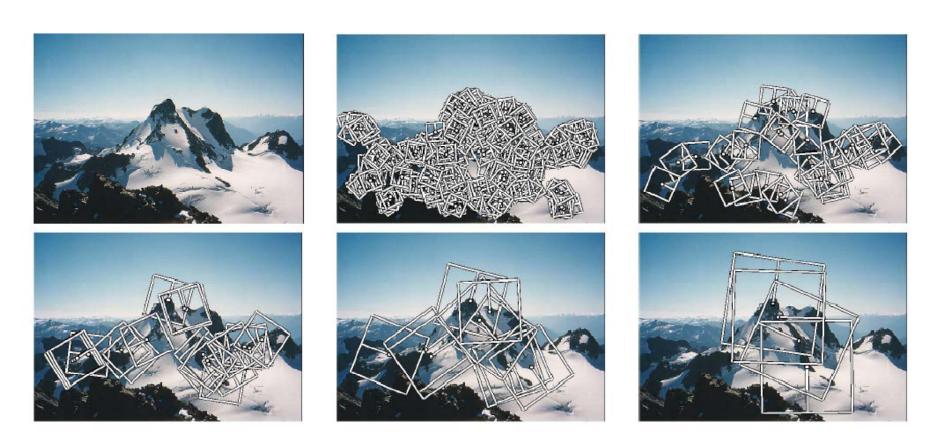

Figure 1. Multi-scale Oriented Patches (MOPS) extracted at five pyramid levels from one of the Matier images. The boxes show the feature orientation and the region from which the descriptor vector is sampled.

Summary

- Multi-scale Harris corner detector
- Sub-pixel refinement
- Orientation assignment by gradients
- Blurred intensity patch as descriptor

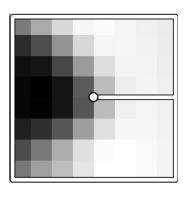

Feature matching

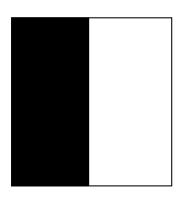

- Exhaustive search
 - for each feature in one image, look at *all* the other features in the other image(s)
- Hashing
 - compute a short descriptor from each feature vector, or hash longer descriptors (randomly)
- Nearest neighbor techniques
 - k-trees and their variants (Best Bin First)

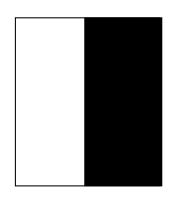

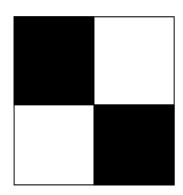

Wavelet-based hashing

 Compute a short (3-vector) descriptor from an 8x8 patch using a Haar "wavelet"

- Quantize each value into 10 (overlapping) bins (10³ total entries)
- [Brown, Szeliski, Winder, CVPR'2005]

Nearest neighbor techniques

- k-D tree and
- Best Bin First (BBF)

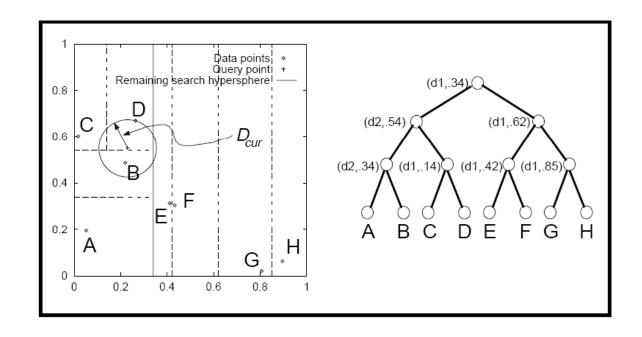

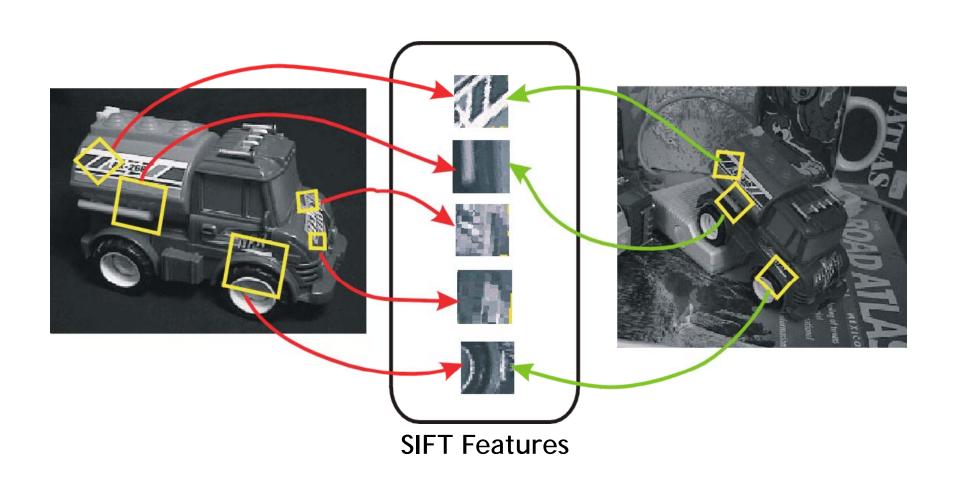

Figure 6: kd-tree with 8 data points labelled A-H, dimension of space k=2. On the right is the full tree, the leaf nodes containing the data points. Internal node information consists of the dimension of the cut plane and the value of the cut in that dimension. On the left is the 2D feature space carved into various sizes and shapes of bin, according to the distribution of the data points. The two representations are isomorphic. The situation shown on the left is after initial tree traversal to locate the bin for query point "+" (contains point D). In standard search, the closest nodes in the tree are examined first (starting at C). In BBF search, the closest bins to query point q are examined first (starting at B). The latter is more likely to maximize the overlap of (i) the hypersphere centered on q with radius D_{cur} , and (ii) the hyperrectangle of the bin to be searched. In this case, BBF search reduces the number of leaves to examine, since once point B is discovered, all other branches can be pruned.
