

Overview of Fancy Topics in Java

Hsuan-Tien Lin

Department of CSIE, NTU

OOP Class, June 2, 2009

We Have Studied

- Java's way of OOP: abstraction, encapsulation, inheritance, polymorphism
 - class, static, ...
 - public, private, ...
 - extends, interface, implements, ...
- Java's way of “beyond-type polymorphism”: generics
 - <lalala>, ?, ...
- Java's way of error handling: exceptions
 - throws, try/catch/finally, ...

Fancy Topics in Java (1/5)

- Swing: a hierarchy of GUI components that can go cross-platform

```
1  JFrame frame = new JFrame("title");
2  JPanel panel = new JPanel();
3  JButton button = new JButton("Press_to_Continue");
4
5  panel.add(button);
6  frame.setContentPane(panel);
```

Fancy Topics in Java (2/5)

- Applet: a small GUI application that can go cross-platform on your webpage

```
1     public class Clock extends Applet{  
2         public void init(){ ... }  
3         public void paint(Graphics g){ ... }  
4     }
```

Fancy Topics in Java (3/5)

- java.net, java.io: doing net programming similar to doing single-machine programming

```
1  try  {
2      u = new URL("http://www.csie.ntu.edu.tw/");
3      /* f = new FileInputStream("my_local_file"); */
4      try {
5          DataInputStream data =
6              new DataInputStream(u.openStream());
7          /* DataInputStream data = new DataInputStream(f); */
8          String line;
9          try {
10              while ((line = theHTML.readLine()) != null) {
11                  System.out.println(line);
12              }
13          }
14          catch (Exception e) { System.err.println(e); }
15      }
16      catch (Exception e) { System.err.println(e); }
17  }
```

The code is a Java program that uses the `DataInputStream` class to read lines from either a URL or a local file. It prints each line to the console. There are two nested try blocks. The inner try block handles exceptions for reading lines. The outer try block handles exceptions for opening the stream. A handwritten note "data" is written above the variable `data` in red ink.

Fancy Topics in Java (4/5)

- Java Servlet: create web services easily

```
1  public class WelcomeServlet extends HttpServlet
2  {
3      public void doGet(
4          HttpServletRequest req,
5          HttpServletResponse res)
6      throws ServletException, IOException
7      {
8          PrintWriter output = res.getWriter();
9          String name = new String(req.getParameter("name"));
10         output.println("Hello, " + name);
11         output.close();
12     }
13 }
```

Fancy Topics in Java (5/5)

- Multithread (concurrent) computing: letting things run together

```
1   Thread[] tarr = new Thread[10];
2   for(int i = 0; i < 10; i++){
3       tarr[i] = new MyThread();
4       t[i].start();
5   }
```
