

Encapsulation

Hsuan-Tien Lin

Department of CSIE, NTU

OOP Class, March 8-9, 2010

Encapsulation (1/5)

```
1 class Record{  
2     String name;  
3     String password;  
4 }  
5  
6 public class RecordDemo{  
7     public static void main(String [] argv){  
8         Record r;  
9         String s, p;  
10        s = getLoginNameFromUser();  
11        r = getRecordFromFile(s);  
12        System.out.println(r.password);  
13        p = getPasswordFromUser();  
14        if (p.equals(r.password)){  
15            // ...  
16        }  
17    }  
18 }
```

- if password not encoded, the SYSOP might easily get your password by `getRecordFromFile`

Encapsulation (2/5)

```
1 class Record{  
2     String name;  
3     String encoded_password;  
4 }  
5  
6 public class RecordDemo{  
7     public static void main(String [] argv){  
8         Record r;  
9         String s, p;  
10        s = getLoginNameFromUser();  
11        r = getRecordFromFile(s);  
12        p = getPasswordFromUser();  
13        if (YOUR_ENODING(p).equals(r.encoded_password)){  
14            // ...  
15        }  
16        //A new and careless programmer adds this line  
17        r.encoded_password = null;  
18    }  
19 }
```

- even when password encoded, a careless programmer may make stupid bugs

Encapsulation (3/5)

```
1 class Record{  
2     private String encoded_password;  
3     public String get_encoded_password(){  
4         return encoded_password;  
5     }  
6 }  
7 public class RecordDemo{  
8     public static void main(String [] argv){  
9         Record r;  
10        String s, p;  
11        s = getLoginNameFromUser();  
12        r = getRecordFromFile(s);  
13        p = getPasswordFromUser();  
14        if (YOUR_ENODING(p).equals(r.get_encoded_password())){  
15            // ...  
16        }  
17        //A new and careless programmer adds this line  
18        r.encoded_password = null; //won't work  
19    }  
20 }
```

- what if you want to set a new password?

Encapsulation (4/5)

```
1 class Record{  
2     String name;  
3     private String encoded_password;  
4     public String get_encoded_password(){  
5         return encoded_password;  
6     }  
7     public void set_encoded_password( String raw_password){  
8         if (blahblah)  
9             encoded_password = YOUR_ENCODING(raw_password);  
10    }  
11 }
```

- **separate implementation and use:** you implement the Record class, and other people (possibly you after two years) use it
- **don't trust other people:** silly mistakes can happen
- **hide unnecessary details** (a.k.a. instance variables)
- **think about possible correct/incorrect use of your class:** check them in the methods

Encapsulation (5/5)

```
1 public class RecordDemo{  
2     public static void main(String [] argv){  
3         Record r;  
4         String s, p;  
5         s = getLoginNameFromUser();  
6         r = getRecordFromFile(s);  
7         p = getPasswordFromUser();  
8         if (r.match_password(p)){  
9             //no need to show encoding to the outside  
10        }  
11        r.set_encoded_password(old_password , new_password);  
12        //don't want this to happen  
13        r.encoded_password = null;  
14    }  
15 }
```

- freedom on making assignments: a potential hole to do bad and/or make bugs
