Chapter 5: Algorithms

- 5.1 The Concept of an Algorithm
- 5.2 Algorithm Representation
- 5.3 Algorithm Discovery
- 5.4 Iterative Structures
- 5.5 Recursive Structures
- 5.6 Efficiency and Correctness

5-2

Definition of Algorithm

An algorithm is an **ordered** set of **unambiguous, executable** steps that defines a **terminating** process.

Copyright © 2015 Pearson Education, Inc.

5-3

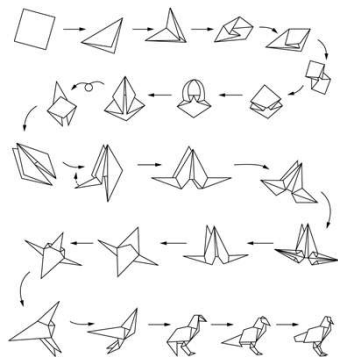

Algorithm Representation

- Requires well-defined primitives
- A collection of primitives constitutes a programming language.

Copyright © 2015 Pearson Education, Inc.

5-4

Figure 5.2 Folding a bird from a square piece of paper

5-6

Pseudocode Primitives

- Assignment

name = *expression*

- Example

RemainingFunds = CheckingBalance + SavingsBalance

Copyright © 2015 Pearson Education, Inc.

5-7

Pseudocode Primitives (continued)

- Conditional selection

```
if (condition):
    activity
```

- Example

```
if (sales have decreased):
    lower the price by 5%
```

Copyright © 2015 Pearson Education, Inc.

5-8

Pseudocode Primitives (continued)

- Conditional selection

```
if (condition):
    activity
else:
    activity
```

- Example

```
if (year is leap year):
    daily total = total / 366
else:
    daily total = total / 365
```

Copyright © 2015 Pearson Education, Inc.

5-9

Pseudocode Primitives (continued)

- Repeated execution

```
while (condition):
    body
```

- Example

```
while (tickets remain to be sold):
    sell a ticket
```

Copyright © 2015 Pearson Education, Inc.

5-10

Pseudocode Primitives (continued)

- Indentation shows **nested** conditions

```
if (not raining):
    if (temperature == hot):
        go swimming
    else:
        play golf
else:
    watch television
```

Copyright © 2015 Pearson Education, Inc.

5-11

Pseudocode Primitives (continued)

- Define a function

```
def name():
```

- Example

```
def ProcessLoan():
```

- Executing a function

```
if (. . .):
    ProcessLoan()
else:
    RejectApplication()
```

Copyright © 2015 Pearson Education, Inc.

5-12

Figure 5.4 The procedure Greetings in pseudocode

```
def Greetings():
    Count = 3
    while (Count > 0):
        print('Hello')
        Count = Count - 1
```

Copyright © 2015 Pearson Education, Inc.

5-13

Pseudocode Primitives (continued)

- Using parameters

```
def Sort(List):
    .
    .
```
- Executing Sort on different lists

```
Sort(the membership list)
Sort(the wedding guest list)
```

5-14

Polya's Problem Solving Steps

- 1. Understand the problem.
- 2. Devise a plan for solving the problem.
- 3. Carry out the plan.
- 4. Evaluate the solution for accuracy and its potential as a tool for solving other problems.

Copyright © 2015 Pearson Education, Inc.

5-15

Polya's Steps in the Context of Program Development

- 1. Understand the problem.
- 2. Get an idea of how an algorithmic function might solve the problem.
- 3. Formulate the algorithm and represent it as a program.
- 4. Evaluate the solution for accuracy and its potential as a tool for solving other problems.

Copyright © 2015 Pearson Education, Inc.

5-16

Getting a Foot in the Door

- Try working the problem backwards
- Solve an easier related problem
 - Relax some of the problem constraints
 - Solve pieces of the problem first (bottom up methodology)
- Stepwise refinement: Divide the problem into smaller problems (top-down methodology)

5-17

Ages of Children Problem

- Person A is charged with the task of determining the ages of B's three children.
 - B tells A that the product of the children's ages is 36.
 - A replies that another clue is required.
 - B tells A the sum of the children's ages.
 - A replies that another clue is needed.
 - B tells A that the oldest child plays the piano.
 - A tells B the ages of the three children.
- How old are the three children?

Copyright © 2015 Pearson Education, Inc.

5-18

Figure 5.5

a. Triples whose product is 36

(1,1,36) (1,6,6)
 (1,2,18) (2,2,9)
 (1,3,12) (2,3,6)
 (1,4,9) (3,3,4)

b. Sums of triples from part (a)

$1 + 1 + 36 = 38$ $1 + 6 + 6 = 13$
 $1 + 2 + 18 = 21$ $2 + 2 + 9 = 13$
 $1 + 3 + 12 = 16$ $2 + 3 + 6 = 11$
 $1 + 4 + 9 = 14$ $3 + 3 + 4 = 10$

5-19

Figure 5.6 The sequential search algorithm in pseudocode

```
def Search (List, TargetValue):
  if (List is empty):
    Declare search a failure
  else:
    Select the first entry in List to be TestEntry
    while (TargetValue > TestEntry and entries remain):
      Select the next entry in List as TestEntry
    if (TargetValue == TestEntry):
      Declare search a success
    else:
      Declare search a failure
```

5-20

Figure 5.7 Components of repetitive control

Initialize: Establish an initial state that will be modified toward the termination condition

Test: Compare the current state to the termination condition and terminate the repetition if equal

Modify: Change the state in such a way that it moves toward the termination condition

Copyright © 2015 Pearson Education, Inc.

5-21

Iterative Structures

- Pretest loop:

```
while (condition):
    body
```

- Posttest loop:

```
repeat:
    body
until(condition)
```

5-25

Figure 5.11 The insertion sort algorithm expressed in pseudocode

```
def Sort(List):
    N = 2
    while (N <= length of List):
        Pivot = Nth entry in List
        Remove Nth entry leaving a hole in List
        while (there is an Entry above the
            hole and Entry > Pivot):
            Move Entry into the hole leaving
            a hole in the list above the Entry
        Move Pivot into the hole
        N = N + 1
```

Copyright © 2015 Pearson Education, Inc.

5-26

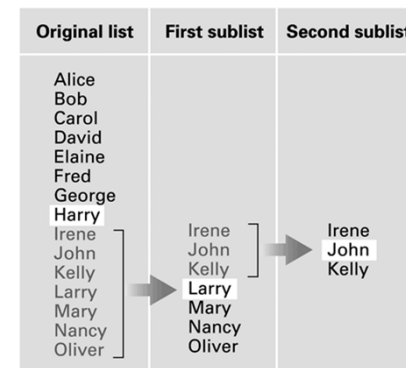

Recursion

- The execution of a procedure leads to another execution of the procedure.
- Multiple activations of the procedure are formed, all but one of which are waiting for other activations to complete.

5-28

Figure 5.13 A first draft of the binary search technique

```

if (List is empty):
    Report that the search failed
else:
    TestEntry = middle entry in the List
    if (TargetValue == TestEntry):
        Report that the search succeeded
    if (TargetValue < TestEntry):
        Search the portion of List preceding TestEntry for
        TargetValue, and report the result of that search
    if (TargetValue > TestEntry):
        Search the portion of List following TestEntry for
        TargetValue, and report the result of that search
    
```

5-29

Figure 5.14 The binary search algorithm in pseudocode

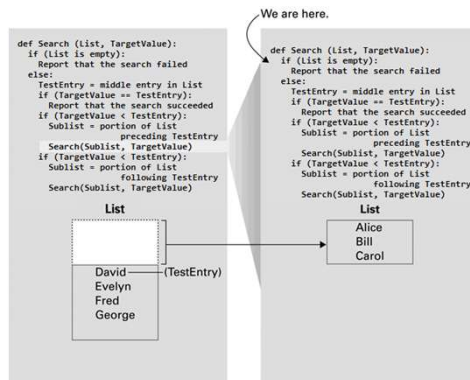

```

def Search(List, TargetValue):
    if (List is empty):
        Report that the search failed
    else:
        TestEntry = middle entry in the List
        if (TargetValue == TestEntry):
            Report that the search succeeded
        if (TargetValue < TestEntry):
            Sublist = portion of List preceding TestEntry
            Search(Sublist, TargetValue)
        if (TargetValue > TestEntry):
            Sublist = portion of List following TestEntry
            Search(Sublist, TargetValue)
    
```

5-33

Algorithm Efficiency

- Measured as number of instructions executed
- Big theta notation: Used to represent efficiency classes
 - Example: Insertion sort is in $\Theta(n^2)$
- Best, worst, and average case analysis

Copyright © 2015 Pearson Education, Inc.

5-34

5-38

Chain Separating Problem

- A traveler has a gold chain of seven links.
- He must stay at an isolated hotel for seven nights.
- The rent each night consists of one link from the chain.
- What is the fewest number of links that must be cut so that the traveler can pay the hotel one link of the chain each morning without paying for lodging in advance?
