

Towards Using EEG to Improve ASR Accuracy

Yun-Nung Chen, Kai-Min Chang, and Jack Mostow

Project LISTEN (www.cs.cmu.edu/~listen)

Problem

Idea:

- Brain activity differs in different mental states
- Use brain activity to adapt automatic speech recognition (ASR)'s language model (LM) to speaker's mental state

Background

- AIED paper uses EEG to classify speaker's mental state as reading easy or difficult text for each utterance

Mostow, J, Kai-Min Chang, and Jessica Nelson. "Toward Exploiting EEG Input in a Reading Tutor," in AIED, 2011.

Approach:

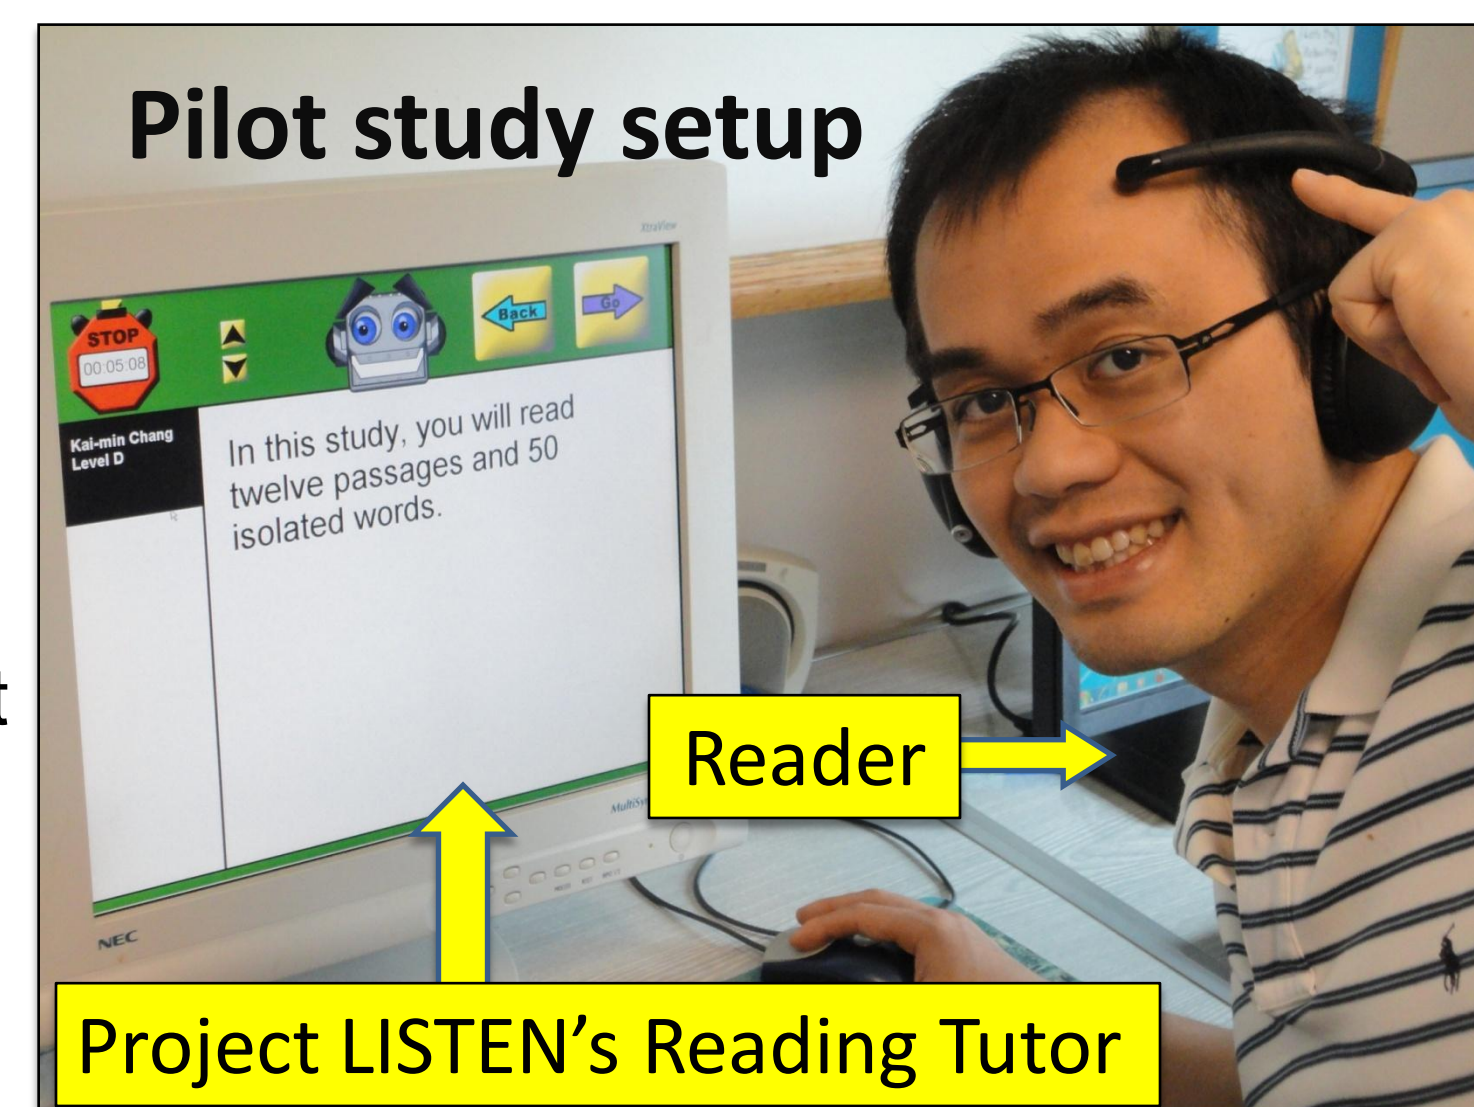

- Use classifier's output to choose LM

Mental State Classification Using EEG

- Input: brain activity – EEG – inexpensive, convenient
- Output: reading **easy** or **difficult** text?
- Classifier: logistic regression
- Within-reader classification result
→ **better than chance**

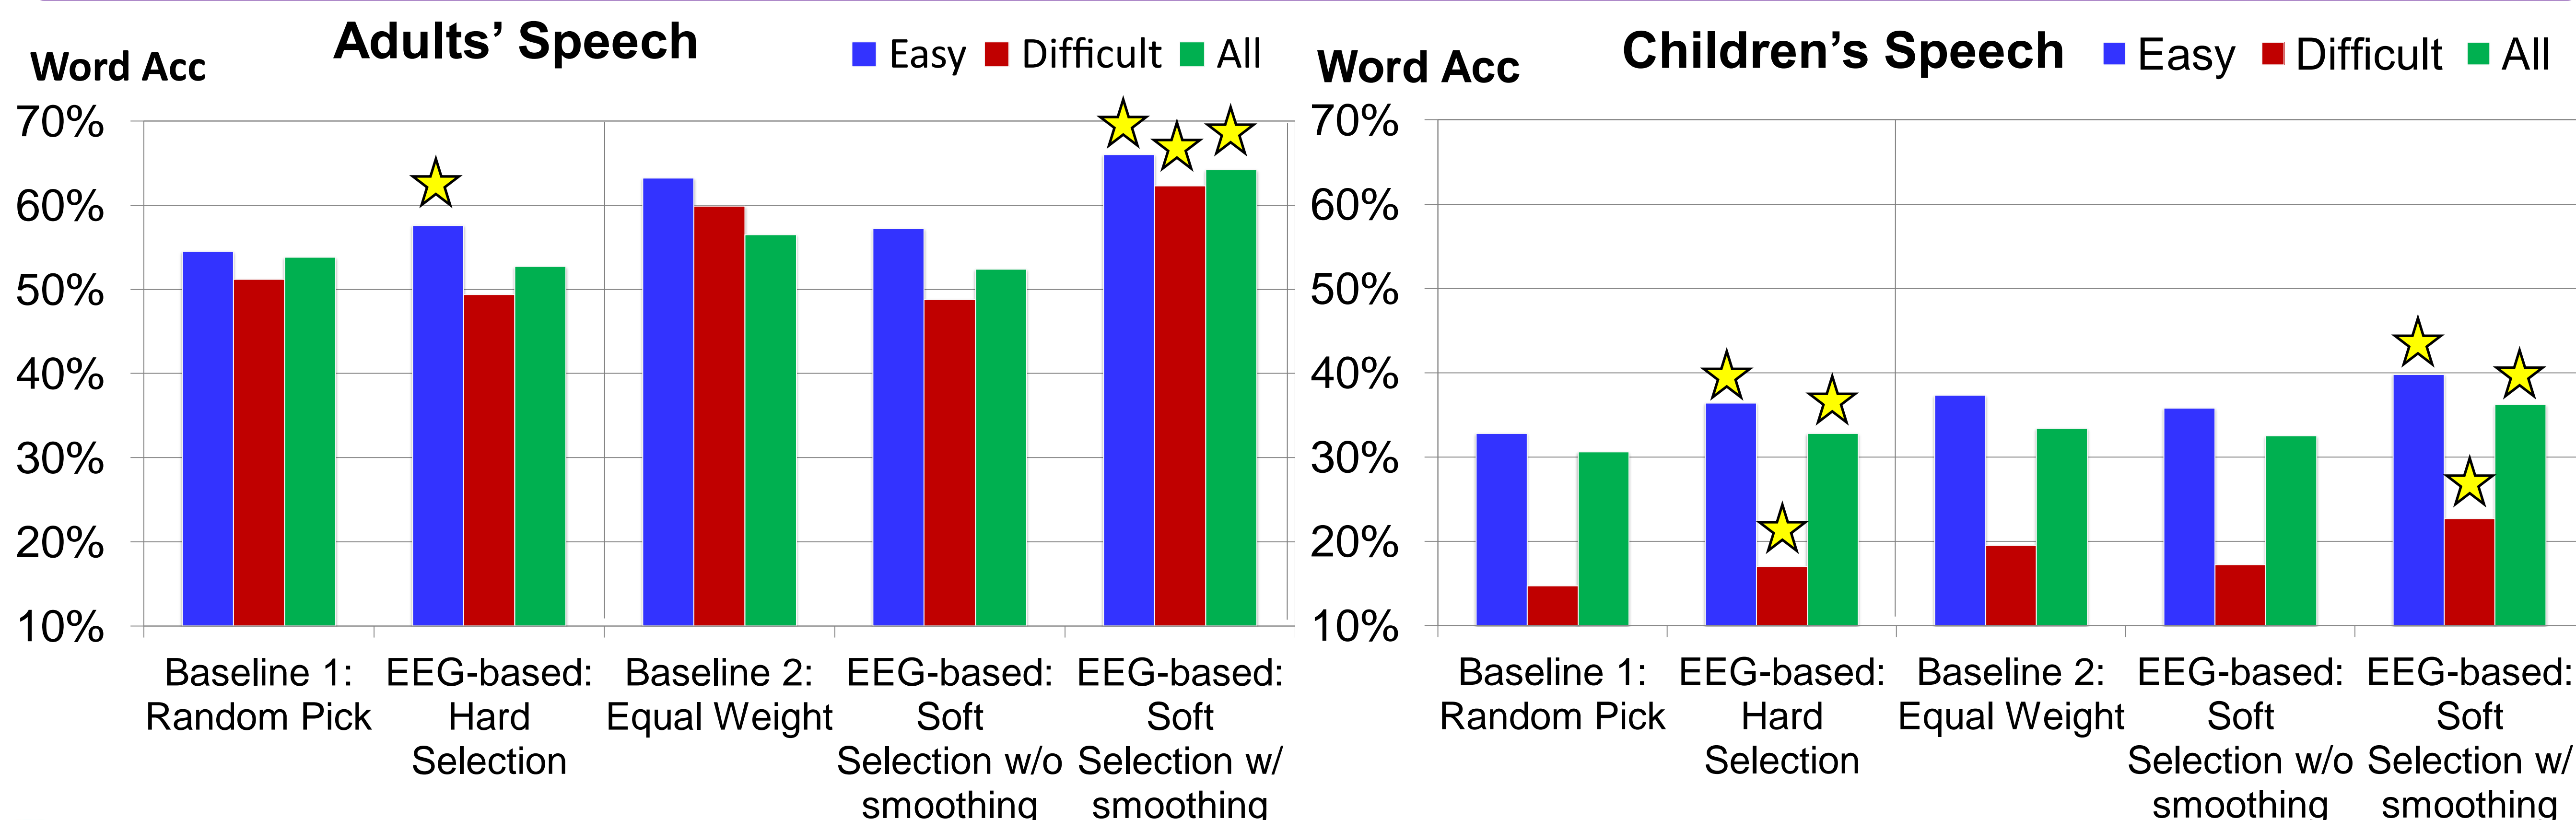

Neurosky Mindset

	Adult	Child
# Utterances	269	243
Accuracy	71.49%	58.74%

Experiments

Overview

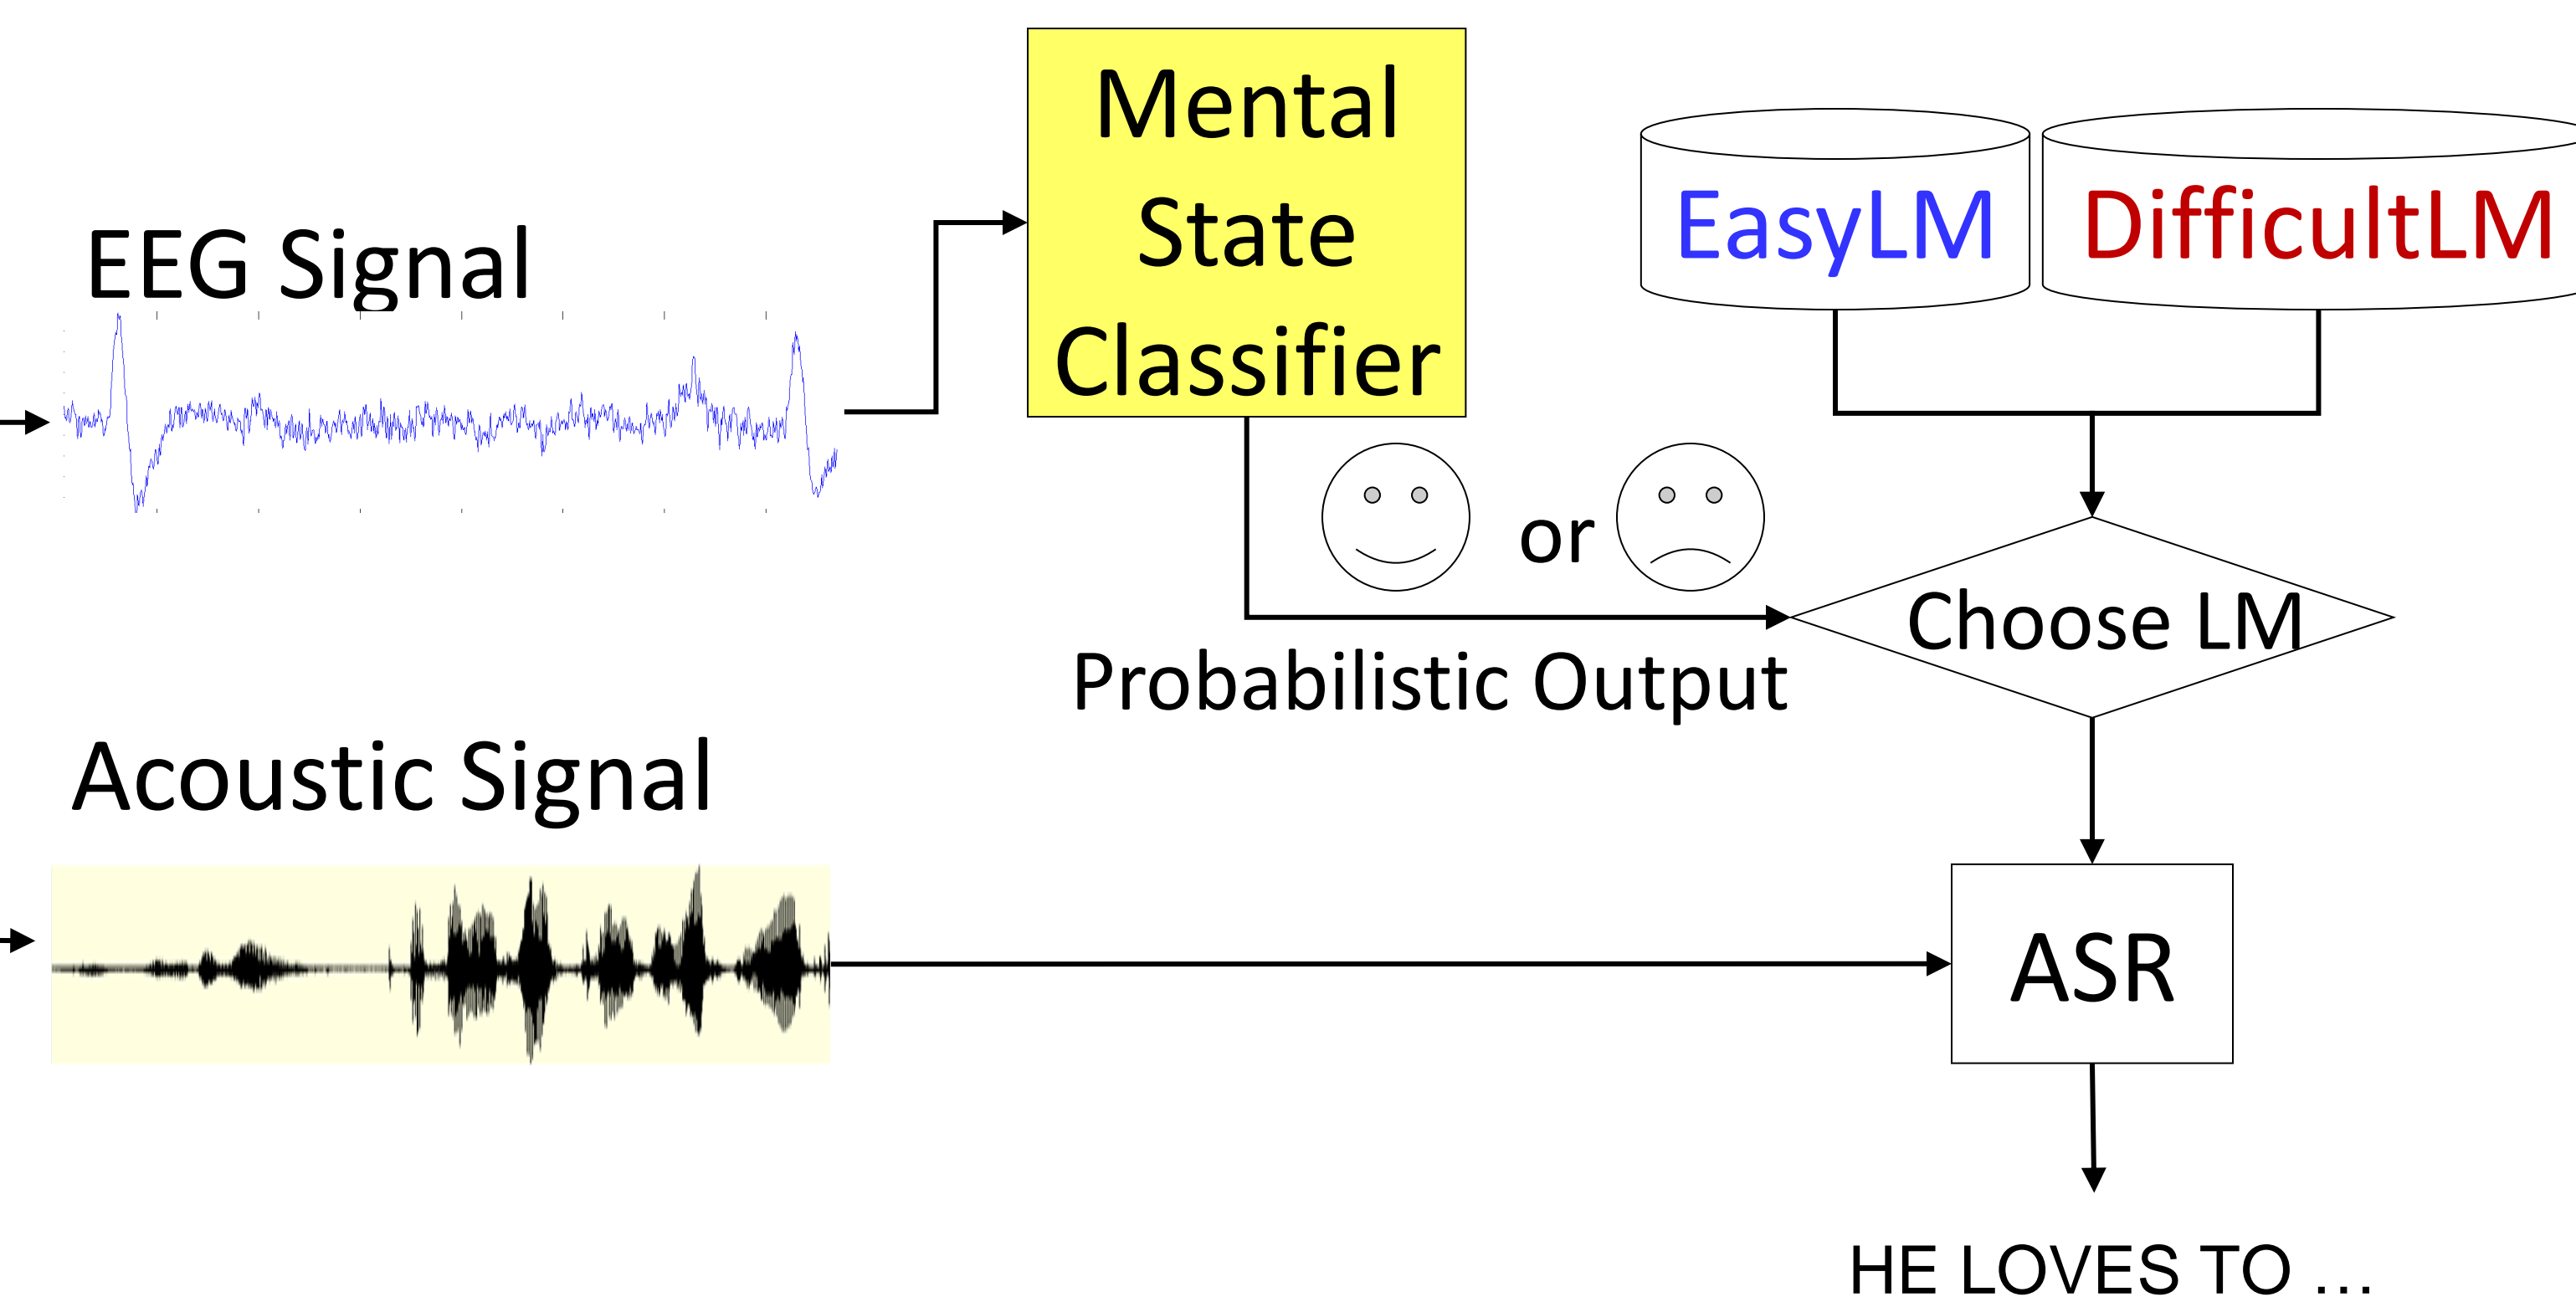

Reading **easy** text

He loves to cook...

Reading **difficult** text

The rough stone emerges...

Language Model Adaptation for ASR

- Idea: choose the weights for LM interpolation to decode the utterances**

- Hard selection (single LM from **EasyLM** or **DifficultLM**)
 - RandomPick (baseline): randomly choose one
 - EEG-based: choose LM based on classification results
- Soft selection (interpolate **EasyLM** and **DifficultLM**)
 - EqualWeight (baseline): equal weights for interpolation
 - EEG-based (w/o smoothing): weights from classifier's probabilistic output
 - EEG-based (w/ smoothing): smoothed classifier's output from 0.25 to 0.75
- Combination with ASR output (see paper)

Conclusions

- Classifying EEG signals from an inexpensive single-channel device can help adapt LMs to improve ASR**
- EEG-based hard selection is better than Random Pick
- EEG-based soft selection w/ smoothing outperforms Equal Weight, because smoothing can compensate the classification errors
- Soft selection approaches are better than hard because interpolated LMs are more robust to classification errors
- Future work: use EEG to detect other mental states and to help ASR
